PROFIBUS
Optical networks with OLM

Plastic and PCF fiber-optic cable

Overview

- Electrical isolation of PROFIBUS devices and PROFIBUS segments
- Protection of the transmission path against electromagnetic interference
- Up to 80 m cable length with plastic fiber-optic cables and up to 400 m with PCF fiber-optic cables
- Rugged fiber-optic standard cables, designed for industrial applications
- Extensive approvals (UL)

Benefits

- Plastic and PCF fiber-optic cables can be pre-assembled on site
- Time savings when commissioning thanks to pre-assembled cables
- Protection of the transmission route against electromagnetic interference
- Tap-proof, as the cable does not emit radiation
- Avoidance of overvoltage and equipotential bonding problems

Application

SIMATIC NET plastic and PCF fiber-optic cables are used together with OLM/P for establishing optical PROFIBUS networks or for optical linking of segments using RS 485 technology in indoor and outdoor applications.

Plastic fiber-optic cables and segmented PCF fiber-optic cables can be assembled on-site with 2 x 2 BFOC connectors.
The maximum cable length between two OLM/P is 80 m.

Longer cable lengths up to 400 m can be achieved using PCF fiber-optic cables. These cables are also available pre-assembled with 4 BFOC connectors.

Design

Different types of plastic and PCF fiber-optic cables are offered:

Plastic fiber-optic cables

- **Plastic FOC, standard cable**;
  rugged round cable with violet PVC outer sheath and Kevlar tension components as well as two plastic fibers with a rugged polyamide inner sheath. For indoor applications; cable lengths up to 80 m.
- **Plastic FOC, duplex core**;
  two flat cores with PVC inner sheath and without outer sheath for indoor applications with low mechanical stress such as laboratory setups or inside cabinets; cable length to 50 m.

PCF fiber optic cables

- **PCF fiber-optic cable, standard cables**:
  Rugged round cables with violet/green PVC outer sheath and Kevlar strain relief elements for applications indoor/outdoors; cable lengths up to 400 m;
   the following cable versions are available:
  - PCF fiber optic standard cable;
    with violet PVC outer sheath for indoor applications.
    The cable is not suitable for assembly in the field;
    (only available pre-assembled with an insertion tool)
  - PCF Standard Cable GP (general purpose);
    with green PVC outer sheath for indoor and outdoor applications.
    The cable is suitable for assembly in the field.
- **PCF fiber optic trailing cable**;
  rugged round cable with green outer sheath and Kevlar tension elements for trailing cable applications; cable lengths of up to 400 m.
  The cables are suitable for assembly in the field.
  The following cable versions are available:
  - PCF Trailing Cable;
    cable for high mechanical stress, PUR outer sheath, no UL approval
  - PCF Trailing Cable GP (general purpose);
    cable for low mechanical stress, PVC outer sheath, with UL approval

More information

You can order components and demonstration materials supplementary to the SIMATIC NET cabling range from your local contact.

Technical advice on this subject is available from:

J. Hertlein
I IA SC IC PRM 4
Phone: +49 (0)911/750 44 65
E-mail: juergen.hertlein@siemens.com

Overview

- Compact, rugged assembly case for PCF fiber-optic cables
- Special versions for easy assembly of HP Simplex and BFOC plugs on PCF fiber-optic cables
- The quality of the assembly can be checked using the enclosed microscope

Benefits

get   Designed for Industry

- Easy installation of the unassembled cables in industrial plants
- Flexible assembly of connectors on PCF fiber-optic cables on site (HP Simplex, BFOC connectors)
- Mistakes are avoided with easy visual inspection of the assembled connector on site using a microscope
- PCF fiber-optic cables are easily repaired on site by installing a new PCF cable

Application

SIMATIC NET PCF fiber-optic conductors are used to construct optical indoor and outdoor PROFIBUS DP networks. They are easy to assemble on site with 2 x 2 Simplex connectors or 2 x 2 BFOC connectors. The maximum cable length between two DP devices is 300 m and between two OLMs 400 m.

PROFIBUS DP devices with integrated optical interface (Simplex connection technology) include, for example, OBT, CP 342-5 FO, CP 5613 FO, IM 153-2 FO, IM 467 FO.

Design

Two versions of the assembly case are available for PCF fiber-optic cables:

- Assembly case for HP Simplex connectors; for on-site pre-assembly of HP Simplex connectors; comprising a stripping tool, buffer stripping tool, Kevlar cutters, fiber breaking tool, crimping tool and microscope
- Assembly case for BFOC connectors; for on-site pre-assembly of BFOC connectors; comprising a stripping tool, buffer stripping tool, Kevlar cutters, fiber breaking tool and microscope

PROFIBUS
Optical networks with OLM

OLM Optical Link Module

Overview

- Construction of optical PROFIBUS networks (line, star, ring) with glass, PCF and plastic fiber optic cables
- High availability can be achieved using a redundant power supply and redundant cable routing
- Function monitoring by means of signaling contact
- All PROFIBUS data transmission rates from 9.6 kbit/s to 12 Mbit/s inclusive 45.45 kbit/s for PROFIBUS PA
- Monitoring of the fiber optic cable routes on LEDs for channel monitoring or using a voltmeter across measurement terminals

Benefits

- High availability of the network thanks to redundant optical ring
- Fast fault localization due to signaling of the fiber-optic line quality to LEDs and signaling contact (e.g. import of the level value of the fiber-optic line quality via an analog module into a programmable logic controller)
- Large range due to use of glass fiber optic cables in lengths of up to 15 km
- OLM/G12-EEC for outdoor use down to -25 °C

Application

With the PROFIBUS OLM (Optical Link Modules), optical PROFIBUS networks can be established in linear, star and redundant ring topologies.

The data transfer rate of a fiber optic line is independent of the distance and can be up to 12 Mbit/s.

Possible applications for OLMs include:

- System buses based on PROFIBUS
- Networking between buildings using glass fiber optic cable
- Mixed networks with electrical and optical segments
- Networks covering a wide area (road tunnels, traffic control systems)
- Networks with high availability requirements (redundant ring networks)

Design

The OLMs have a compact metal housing. It is suitable for mounting on a standard rail or for wall mounting with a mounting plate.

The 24 V power supply is fed in through a terminal block and can be redundantly connected.

The signaling contact allows a digital signal to be transferred to PLCs or HMI systems for evaluation.

OLMs can be combined with each other and individual stations or complete electrical segments can be integrated into the optical PROFIBUS network through an electrical interface. With the PROFIBUS OLM P22 and OLM G22, two electric PROFIBUS segments can be connected separated from each other.

OLMs are available with one or two fiber optic interfaces with BFOC connectors for different types of fiber optic cables:

- Plastic fiber-optic cables (980/1000 µm) can be used for single lengths of up to 80 m. They can also be assembled with BFOC cable connectors on site.
- PCF fiber-optic cables (200/230 µm) can be used for single lengths of up to 400 m. They are offered preassembled with four BFOC plugs and an insertion tool.
- Glass fiber multimode fiber-optic cables (62.5/125 µm) such as the SIMATIC NET Fiber Optic cables can be used for long distances of up to 3000 m. They must be ordered preassembled with 4 BFOC plugs or as a FastConnect FO system for assembly on site.
- Singlemode fiber-optic cables (10/125 µm or 9/125 µm fibers) can be used for extremely long distances up to 15 km.

Function

- Automatic detection of all PROFIBUS data transmission rates 9.6 kbit/s to 12 Mbit/s inclusive 45.45 kbit/s (PROFIBUS PA)
- Construction of the following network topologies: Line, star, redundant ring
- High availability due to media redundancy. The distance between two OLMs in the redundant ring is only limited by the optical range of the modules
- RS485 interface with segment capability (Sub-D female connector)
- Unrestricted multimaster operation: Expanded segmentation functions for localization of faults to fiber optic and RS485 segments
- Fast localization of faults:
  - Indication of module status through floating signaling contact
  - Checking the fiber optic cable route quality on LEDs
  - Checking the fiber optic cable route quality Measurement output for optical receiver for logging and plausibility checking of the fiber optic path attenuation with a voltmeter
- High cascading depth: Line and redundant ring up to 124 OLM (only limited by monitoring times)

Integration

Example of a system configuration with OLM for PROFIBUS in a ring structure

Optical line topology with PROFIBUS OLM G11/G12

■ **Integration** (continued)

Optical star topology with PROFIBUS OLM G11/G12

PROFIBUS
Optical networks with OLM

OLM Optical Link Module

Ordering data	Order No.	Order No.
PROFIBUS OLM/P11	**6GK1 503-2CA00**	
Optical link module with 1 x RS 485 and 1 x plastic fiber-optic interface (2 BFOC sockets), with signaling contact and measuring output incl. 2 BFOC plugs for plastic fiber-optic cables		

PROFIBUS OLM/G11-1300	**6GK1 503-2CC00**
Optical link module with 1 x RS 485 and 1 x glass fiber-optic interface (2 BFOC sockets), 1300 nm wavelength for large distances up to 15 km, with signaling contact and measuring output	

PROFIBUS OLM/P12	**6GK1 503-3CA00**
Optical link module with 1 x RS 485 and 2 x plastic fiber-optic interface (4 BFOC sockets), with signaling contact and measuring output incl. 4 BFOC plugs for plastic fiber-optic cables	

PROFIBUS OLM/G12-1300	**6GK1 503-3CC00**
Optical link module with 1 x RS 485 and 2 x glass fiber-optic interface (4 BFOC sockets), 1300 nm wavelength for large distances up to 15 km, with signaling contact and measuring output	

PROFIBUS OLM/P22	**6GK1 503-4CA00**
Optical link module with 2 x RS 485 and 2 x plastic fiber-optic interface (4 BFOC sockets), with signaling contact and measuring output incl. 4 BFOC plugs for plastic fiber-optic cables	

PROFIBUS OLM/G12 EEC	**6GK1 503-3CD00**
Optical link module with 1 x RS 485 and 2 x glass fiber-optic interface (4 BFOC sockets), for standard distances up to 3000 m, for extended temperature range –25 °C to +60 °C, with signaling contact and measuring output	

PROFIBUS OLM/G11	**6GK1 503-2CB00**
Optical link module with 1 x RS 485 and 1 x glass fiber-optic interface (2 BFOC sockets), for standard distances, with signaling contact and measuring output	

PROFIBUS OLM mounting plate	**6GK1 503-8AA00**
For wall mounting of PROFIBUS OLM V4	

PROFIBUS OLM/G12	**6GK1 503-3CB00**
Optical link module with 1 x RS 485 and 2 x glass fiber-optic interface (4 BFOC sockets), for standard distances up to 3000 m, with signaling contact and measuring output	

SITOP compact 24 V/ 0.6 A	**6EP1 331-5BA00**
1-phase power supply with wide-range input 85 – 264 V AC/ 110 – 300 V DC, stabilized output voltage 24 V, rated output current value 0.6 A, slim design	

PROFIBUS OLM/G22	**6GK1 503-4CB00**
Optical link module with 2 x RS 485 and 2 x glass fiber-optic interface (4 BFOC sockets), for standard distances up to 3000 m, with signaling contact and measuring output	

3

Overview

- Construction of optical PROFIBUS networks (line, star, ring) with glass, PCF and plastic fiber-optic cables
- High availability can be achieved using a redundant power supply and redundant cable routing
- Function monitoring by means of signaling contact
- All PROFIBUS data transmission rates from 9.6 kbit/s to 12 Mbit/s including 45.45 kbit/s for PROFIBUS PA
- Monitoring of the fiber-optic cable routes on LEDs for channel monitoring or using a voltmeter across measurement terminals

Note:

SIPLUS extreme products are based on Siemens Industry standard products. The contents listed here were taken from the respective standard products. SIPLUS extreme-specific information was added.

3

Overview

- Electrical isolation of DP devices
- Protection of the transmission path against electromagnetic interference
- Up to 50 m cable length with plastic fiber-optic cables and up to 300 m with PCF fiber-optic cables
- Rugged fiber-optic standard cables, designed for industrial applications
- Hybrid cable for the shared transmission of data and power supply
- Extensive approvals (UL)

Benefits

get Designed for Industry

- Plastic and PCF fiber-optic cables can be pre-assembled on site
- Easy connector assembly on site
- Time savings on start-up thanks to pre-assembled cables
- Protection of the transmission path against electromagnetic interference
- Tap-proof, because the cable does not radiate
- A cable for the shared transmission of data and power

Application

SIMATIC NET plastic and PCF fiber-optic conductors are used to construct optical indoor PROFIBUS DP networks.

Plastic fiber-optic cables and segmented PCF fiber-optic cables can be assembled easily on site with 2 x 2 simplex plugs. The maximum cable length between two DP devices is 50 m.

Longer cable lengths up to 300 m can be achieved using PCF fiber-optic cables. These cables are also available pre-assembled with 4 simplex plugs.

Devices with integrated optical interface (Simplex connection technology) include, for example, OBT, CP 342-5 FO, CP 5613 FO, IM 153-2 FO, IM 467 FO.

Design

Different types of plastic and PCF fiber-optic cables are offered:

- **Plastic FOC, duplex core;**
  Two flat cores with PVC inner sheath and without outer sheath for indoor applications with low mechanical stress such as laboratory setups or inside cabinets. Cable lengths up to 50 m.

- **Plastic FOC, standard cable;**
  Rugged round cable with violet PVC outer sheath and Kevlar tension components as well as two plastic fibers with a rugged polyamide inner sheath. For indoor applications with cable lengths up to 50 m.

- **PCF fiber-optic cable, standard cables:**
  - PCF Fiber Optic standard cable;
    rugged round cable with violet PVC outer sheath and Kevlar tension components for indoor applications with cable lengths of up to 300 m.
    The cable is not suitable for assembly in the field (only available pre-assembled with an insertion tool)
  - PCF Standard Cable GP (general purpose);
    rugged round cable with green PVC outer sheath and Kevlar tension elements for indoor and outdoor applications with cable lengths of up to 300 m;
    the cable is suitable for assembly in the field.

- **PCF fiber-optic trailing cable;**
  Rugged round cable with green outer sheath and Kevlar tension elements for trailing cable applications with cable lengths of up to 300 m. The cable is suitable for assembly in the field.
  Two cable variants are available for this application:
  - PCF Trailing Cable;
    cable for high mechanical stress, PUR outer sheath, no UL approval
  - PCF Trailing Cable GP (general purpose);
    cable for low mechanical stress, PVC outer sheath, with UL approval

Overview

- Electrical isolation of DP devices
- Protection of the transmission path against electromagnetic interference
- Up to 50 m cable length with plastic fiber-optic cable
- Rugged fiber-optic cables, designed for industrial applications
- Hybrid cable for the shared transmission of data and power supply

Benefits

g e t **get** Designed for Industry

- Savings in wiring, installation, commissioning and operation as result of standardized connection system (copper or fiber-optic) with high degree of protection (IP65)
- With ECOFAST, the turnaround times for offers, planning and engineering of machines and plants can be reduced:
- ECOFAST permits fast and problem-free startup of automation and drive systems
- Minimization of sources of error by means of standardized interfaces and plug connectors.
- With ECOFAST plants remain highly available: No interruption of power and field bus when replacing equipment.

Application

The ECOFAST Fiber Optic Hybrid Cable of SIMATIC NET is used to construct optical PROFIBUS DP networks indoors. It is particularly suitable for connecting DESINA components installed at machine level, and is easy to assemble on site. The maximum cable length between two DP devices is 50 m.

Design

The rugged, hybrid trailing cable contains two plastic fiber-optic cables for data transmission and four copper wires (1.5 mm^2) for supplying power to DESINA [1] stations.

[1] DESINA is the trademark for **DE**centralized and **S**tandardized **IN**stall**A**tion technology for machine tools.

ECOFAST Fiber Optic Hybrid Cable

■ **Technical specifications**

Order No.	6XV1 830-6CH10
Product type designation	**ECOFAST Fiber Optic Hybrid Cable (DESINA-conformant)**
Product description	ECOFAST hybrid cable (optical fibers and power cores), sold by the meter, in bulk
Suitability for application	Devices in conformance with DESINA (e.g. for ET 200X), for design of optical PROFIBUS DP indoor networks
Cable designation	I-(ZN)V4Y11Y 2P 980/1000 + 4x1.5
Cable length	-
Electrical specifications	
Operating voltage, rms value	100 V
Conductor cross-section of power core	1.5 mm²
Continuous current of power cores	12 A
Optical data	
Maximum damping factor per length at 660 nm	280 dB/km
Bandwidth length product at 650 nm	10 GHz·m
Mechanical data	
Number of fibers per FO core	1
Number of FO cores per FO cable	2
Design of FO fiber	Step index fiber 980/1000 µm
Design of FO core	-
Design of FO cable	Splittable
Number of electrical cores	4
Outer diameter	
• of optical fiber	980 µm
• of optical fiber sheath	1 000 µm
• of FO core sheath	2.2 mm
• of cable	10.6 mm
Material	
• of optical fiber core	Polymethylmethacrylate (PMMA)

Overview

- Compact, rugged assembly case for PCF fiber-optic cables
- Special versions for easy assembly of HP Simplex and BFOC plugs on PCF fiber-optic cables
- The quality of the assembly can be checked using the enclosed microscope

Benefits

get   Designed for Industry

- Easy installation of the unassembled cables in industrial plants
- Flexible assembly of connectors on PCF fiber-optic cables on site (HP Simplex, BFOC connectors)
- Mistakes are avoided with easy visual inspection of the assembled connector on site using a microscope
- PCF fiber-optic cables are easily repaired on site by installing a new PCF cable

Application

SIMATIC NET PCF fiber-optic conductors are used to construct optical indoor and outdoor PROFIBUS DP networks. They are easy to assemble on site with 2 x 2 Simplex connectors or 2 x 2 BFOC connectors. The maximum cable length between two DP devices is 300 m and between two OLMs 400 m.

PROFIBUS DP devices with integrated optical interface (Simplex connection technology) include, for example, OBT, CP 342-5 FO, CP 5613 FO, IM 153-2 FO, IM 467 FO.

Design

Two versions of the assembly case are available for PCF fiber-optic cables:

- Assembly case for HP Simplex connectors; for on-site pre-assembly of HP Simplex connectors; comprising a stripping tool, buffer stripping tool, Kevlar cutters, fiber breaking tool, crimping tool and microscope
- Assembly case for BFOC connectors; for on-site pre-assembly of BFOC connectors; comprising a stripping tool, buffer stripping tool, Kevlar cutters, fiber breaking tool and microscope.

PROFIBUS
Optical networks with OBT and integrated interface

Optical bus terminal OBT

Overview

- For connecting a PROFIBUS station without an integrated fiber-optic cable interface or an RS 485 segment to an optical line
- Quick and easy installation of the plastic fiber-optic cable without the need for special tools

Benefits

get **Designed for Industry**

- Option of connecting existing devices or an RS 485 segment with electrical interface to the optical PROFIBUS
- "Socket outlet" for connecting mobile devices (e.g. programming devices) without interruption of the bus
- Time saved through simple and fast connector mounting without special tools

Application

The OBT (Optical Bus Terminal) is used to connect a PROFIBUS station without integral optical interface or a PROFIBUS DP RS485 segment to an optical line. Existing DP devices are then provided with the advantages of optical data transmission.

The PROFIBUS station is connected to the RS 485 interface of the OBT via a cable terminated at both ends, e.g. connecting cable 830-1T. The OBT is integrated into the optical line using two optical interfaces.

The following optical transmission media can be connected to the OBT:

- Plastic fiber-optic cables can be used up to an individual segment length of 50 m. They can be configured very easily on site with 2 x 2 Simplex connectors.
- PCF [1] fiber-optic cables can be used for an individual segment length up to 300 m. These cables are preassembled. The OBT supports all PROFIBUS data transmission rates up to 12 Mbit/s.

[1] Also known as HCS® fiber-optic cable:
     HCS® is a registered trademark of Lucent Technologies.

Design

The OBT has a compact plastic housing. It is suitable for mounting on a DIN rail or for wall mounting with a mounting plate with the aid of two holes drilled right through.

The OBT has the following connections:

- 9-pin sub-D socket for connecting the PROFIBUS DP node such as programming device (PG), PC, operator panel (OP), S7-300 or nodes without integral optics, e.g. ET 200S or PROFIBUS DP components from other suppliers or a PROFIBUS DP-RS 485 segment.
- Two optical interfaces for the connection of plastic and PCF fiber-optic cables with Simplex connectors (connection to CP 342-5 FO, CP 5613 FO, IM 153-2 FO, IM 467 FO or to ET 200 with integrated optics)
- 24 V DC infeed for power supply.

Function

- Connection of a station with RS 485 interface via connecting cable 830-1T or PROFIBUS cable with bus connectors (terminated at both ends) or an RS 485 segment
- Provision of an electrical connection point on the optical line (e.g. PG connection for startup and diagnostics)
- Support for all PROFIBUS data rates from 9.6 kbit/s to 12 Mbit/s including 45.45 kbit/s for PROFIBUS PA
- Regeneration of the signals in amplitude and time
- Cascade depth when using user-defined bus parameters up to 126 stations
- Galvanic isolation of the station via fiber optic cable
- Simple diagnostics via LED display for operating voltage as well as for receipt of data CH1, CH2 and CH3.

Overview

PROFIBUS communication for SIMATIC S7

CPs with standard functions

- CM 1242-5 and CM 1243-5 for SIMATIC S7-1200 for connection to PROFIBUS as DP slave or DP master
- CP 342-5 and CP 343-5 for SIMATIC S7-300 for connection to PROFIBUS DP or PROFIBUS FMS
- CP 443-5 Extended and CP 443-5 Basic for the connection to PROFIBUS DP or PROFIBUS FMS
- Designed for use in harsh industrial environments
- Shipbuilding certification for use on ships and offshore units
- High-speed data transfer due to transfer rates of up to 12 Mbit/s

CPs with function expansions

- CP 342-5 FO with integral optical interface for connecting the SIMATIC S7-300 to the optical PROFIBUS DP

3

PROFIBUS
Communication for SIMATIC S7-1200

CM 1242-5

■ Overview

DP-M	DP-S	FMS	PG/OP	S7
	●			

The CM 1242-5 communication module is used to connect a SIMATIC S7-1200 to PROFIBUS as a DP slave and has the following characteristics:

- PROFIBUS DPV1 slave in accordance with IEC 61158
- Module replacement without PG supported
- Power is supplied via the backplane bus so that no extra cabling is required
- Support of all standard baud rates from 9.6 kbit/s to 12 Mbit/s
- Compact industry-standard enclosure in S7-1200 design for mounting on a standard mounting rail
- Fast commissioning thanks to easy configuration using STEP 7 without additional programming overhead

The CM 1242-5 is intended for use in factory automation. Low-cost PROFIBUS-based automation solutions can be created on the basis of the S7-1200 for optimal production.

■ Benefits

g e t
get Designed for Industry

PROFIBUS-based systems can be operated effectively for lower operating and maintenance costs:

- Low costs since an automation solution requires no fixed wiring and less hardware
- Fast response to faults thanks to comprehensive diagnostics options
- Optimized plant and inventory management

The CM 1242-5 also offers further benefits especially for the requirements of micro-automation solutions:

- Uncomplicated connection of the S7-1200 to PROFIBUS without extra power supply
- Low-cost implementation of automation solutions based on PROFIBUS
- Fast commissioning, as no programming overhead is required

■ Application

The CM 1242-5 is designed for use in factory automation.

With the CM 1242-5, low-cost, distributed automation solutions can be implemented on the basis of the S7-1200 , or in simple cases even complete plant automation systems. It can be used in all sectors of discrete automation. These include, for example:

- Automotive
- Pharmaceuticals
- Semiconductors
- Food processing industry

■ **Design**

The CM 1242-5 offers all the benefits of the S7-1200 design.

- Rugged, compact plastic enclosure
- Easily accessible connection and diagnostics elements, protected by front flaps
- Removable connecting terminals
- Simple mounting on the mounting rail of the S7-1200
- 9-pin sub-D socket for the bus interface to PROFIBUS

The CM 1242-5 is plugged into the left-hand system bus interface of the S7-1200. Power is supplied via the system bus of the S7-1200 so that no extra cabling is required. The rugged RS485 interface is located on the underside of the module, protected by the lower front flap.

■ **Function**

The CM 1242-5 provides the communication services for integrating an S7-1200 into an automation solution as a PROFIBUS DP slave.

PROFIBUS DP slave

The CM 1242-5 works as a DPV1 slave in accordance with IEC 61158, handles data traffic completely autonomously, and thus relieves the CPU of communication tasks.

The data areas of the distributed I/Os are transferred consistently between CP and CPU.

Diagnosis

Extensive diagnostic options are available via STEP 7, including

- Operating state of the CM
- General diagnostics functions
- Connection diagnostics
- Message buffer

STEP 7 Basic V11 or higher is required for configuring the full functional scope of the CP 1242-5.

PROFIBUS
Communication for SIMATIC S7-1200

CM 1243-5

3

■ Overview

DP-M	DP-S	FMS	PG/OP	S7
●			●	●

The CM 1243-5 communication module is used to connect a SIMATIC S7-1200 to PROFIBUS as a DP master and has the following characteristics:

- PROFIBUS DPV1 master in accordance with IEC 61158
- Support of up to 16 PROFIBUS DP slaves
- Communication with other S7 controllers based on S7 communication
- Allows the connection of programming devices and operator panels with a PROFIBUS interface to the S7-1200
- Module replacement without PG supported
- Support of all standard baud rates from 9.6 kbit/s to 12 Mbit/s
- Compact industry-standard enclosure in S7-1200 design for mounting on a standard mounting rail
- Fast commissioning thanks to easy configuration using STEP 7 without additional programming overhead

The CM 1243-5 is intended for use in factory automation. Low-cost PROFIBUS-based automation solutions can be created on the basis of the S7-1200 for optimal production.

■ Benefits

get Designed for Industry

PROFIBUS-based systems can be operated effectively for lower operating and maintenance costs:

- Low costs since an automation solution requires no fixed wiring and less hardware
- Fast response to faults thanks to excellent diagnostics options
- Optimized plant and inventory management

The CM 1243-5 also offers further benefits especially for the requirements of micro-automation solutions:

- Uncomplicated connection of the S7-1200 to PROFIBUS
- Low-cost implementation of automation solutions based on PROFIBUS
- Fast commissioning, as no programming overhead is required

Use of PROFIBUS-based micro-automation solutions enables optimal operation of the plant and problem-free production.

■ Application

The CM 1243-5 is designed for use in factory automation, particularly for mechanical engineering

With the CM 1243-5, low-cost, distributed automation solutions can be implemented on the basis of the S7-1200 , or in simple cases even complete plant automation systems. It can be used in all sectors of discrete automation. These include, for example:

- Automotive
- Pharmaceuticals
- Semiconductors
- Food processing industry

In mechanical engineering, the S7-1200 can be used with the CM 1243-5 as a central control unit, with sensors, actuators or the HMI devices connected direct via PROFIBUS.

- Pick-and-place machines
- Metalworking machines
- Packaging machinery
- Printing machines
- Textile machines
- Filling machines

Design

The CM 1243-5 offers all the benefits of the S7-1200 design.

- Rugged, compact plastic enclosure
- Easily accessible connection and diagnostics elements, protected by front flaps
- Removable connecting terminals
- Simple mounting on the mounting rail of the S7-1200
- 9-pin sub-D socket for the bus interface to PROFIBUS
- 3-pin plug-in terminal strip for connection of the 24 V DC external supply voltage

The CM 1243-5 is plugged into the left-hand system bus interface of the S7-1200. The power is supplied via a 3-pin terminal strip on top of the module. The rugged RS485 interface is located on the underside of the module, protected by the lower front flap.

Function

The CM 1243-5 provides access to different communication services on the basis of PROFIBUS:

- PROFIBUS DP (according to IEC 61158, master)
- PG/OP communication
- S7 communication

PROFIBUS DP master

The CM 1243-5 works as a DP-V1 master in accordance with IEC 61158, handles data traffic completely autonomously, and thus relieves the CPU of communication tasks.

The data areas of the distributed I/Os are transferred consistently between CP and CPU. As a DP master, it allows the connection of up to 16 PROFIBUS-compliant DP slaves

PG/OP communication

The S7-1200 to which the CM 1243-5 is connected can be programmed with the help of PG/OP communication.

S7 communication

Communication with the following other systems can be implemented with the mechanisms familiar from the S7 world (Put/Get) on the basis of S7 communication:

- To other SIMATIC S7 programmable controllers
- To HMI devices
- To PCs, laptops, field PGs with PROFIBUS cards

Diagnosis

Extensive diagnostic options are available via STEP 7, including

- Operating state of the CM
- General diagnostics and statistics functions
- Connection diagnostics
- Message buffer

STEP 7 Basic V11 or higher is required for configuring the full functional scope of the CP 1243-5.

PROFIBUS
Communication for SIMATIC S7-1200

PROFIBUS
Communication for SIMATIC S7-300

CP 342-5

Overview

DP-M	DP-S	FMS	PG/OP	S7/S5	
●	●		●	●	

- PROFIBUS DP master or slave with electrical interface for connecting the SIMATIC S7-300 to PROFIBUS at up to 12 Mbit/s (including 45.45 kbit/s)
- Communication services:
  - PROFIBUS DP
  - PG/OP communication (OP multiplexing)
  - S7 communication (client, server)
  - Open communication (SEND/RECEIVE)
- Easy configuration and programming over PROFIBUS
- Cross-network programming device communication through S7 routing
- Modules can be replaced without the need for a PG

Benefits

get **get** Designed for Industry

- Expansion of the process I/O at SIMATIC S7-300 by several PROFIBUS DP interfaces
- Flexible utilization of the process I/O through dynamic activation of DP slaves
- Subprocess-oriented configuration of an automation solution by implementing several CPs
- Optimization of applications and many application options through sending of data with S7 communication
- Comprehensive control and monitoring through multiplex function with OP communication
- Suitable for closed loop control tasks due to SYNC and FREEZE.

Application

The CP 342-5 is the communications processor of the SIMATIC S7-300 for the PROFIBUS DP bus system.

The CP 342-5 relieves the CPU from communication tasks.

Communication possibilities of the S7-300 using communication modules:

- As DP master or slave for PROFIBUS DP V0 according to IEC 61158/EN 50170
- Communication with programming devices and HMI devices
- Communication with other SIMATIC S7 systems
- Communication with SIMATIC S5 programmable controllers

The number of CPs that can be used is dependent on the performance range of the CPU and on the communications services used.

Design

The CP 342-5 offers all the advantages of SIMATIC S7-300 system design:

- Compact design;
  single standard width of the SM modules of the SIMATIC S7-300
- 9-pin Sub-D socket for connection to PROFIBUS
- 4-pin terminal block for connecting the external supply voltage of 24 V DC
- Simple assembly;
  The CP 342-5 is mounted on the S7-300 DIN rail and connected to adjacent modules by means of the bus connectors. Slots 4 to 11 in subracks 0 to 3 (coupled through the IM 360/361) can be used for the CP 342-5
- In combination with IM 360/361, the CP 342-5 can also be used in an expansion rack (ER)
- User-friendly wiring;
  Sub-D socket and the terminal block are easily accessible.
- The CP 324-5 can be operated without a fan;
  a back-up battery or a memory module is not required

■ Function

The CP 342-5 provides access to different communication services of the PROFIBUS bus system:

- PROFIBUS DP (according to IEC 61158/61784, master or slave)
- PG/OP communication
- S7 communication (client, server)
- Open communication (SEND/RECEIVE)

PROFIBUS DP master

The CP 342-5 operates as a DP-V0 Master according to IEC 61158/EN 61784 Volume 2 and processes the data transfer completely independently. It supports the services of the Master Classes 1 and 2.

The data areas of the distributed I/Os are transferred consistently between CP and CPU. This applies to the use of the CP as DP Master and as DP Slave. As DP Master, it permits connections to:

- SIMATIC S7-300, such as CP 342-5 as DP slave
- DP slaves of the distributed I/O system ET 200 (integrate as DP-V0 slave)
- PCs, e.g. with CP 5512, CP 5611 A2, CP 5621, CP 5614 A2 and SOFTNET-PB DP slave or DP-Base

The CP 342-5 also offers the SYNC, FREEZE and shared input/output functions, as well as the activation/deactivation of slaves.

PROFIBUS DP slave

The CP 342-5 as a DP-V0 slave permits the SIMATIC S7-300 to exchange data with other PROFIBUS DP masters, which allows a hybrid setup between SIMATIC S5/S7, PCs, ET 200 and other field devices to PROFIBUS DP. Function calls are required for the DP communication. These (DP-SEND/DP-RECV) must be integrated in the STEP 7 user program.

PG/OP communication

PG/OP communication allows all S7 stations connected to the network to be remotely programmed.

- S7 routing
  With the aid of S7 routing it is possible to use programming device communication across networks.
  Via the CP 342-5 as many as 16 TD/OPs can be merged into one S7-300 station. This requires only one connection resource in the S7-CPU (multiplex channel). The multiplex channel supports the acyclic HMI services.

S7 communication

S7 communication is used for the coupling:

- between SIMATIC S7 automation systems
- to HMI devices (OPs).
- to PCs, e.g. with CP 5512, CP 5611 A2, CP 5621 and SOFTNET-PB S7 or CP 5613 A2, CP 5613 FO, CP 5614 A2, CP 5623, CP 5624 and HARDNET-PB S7.

Communication with PG and OP takes place without further configuration. In addition, the central controller can also be programmed and configured on a distributed basis via the CP 342-5.

The client functionality is provided by means of loadable communication blocks.

Open communication (SEND/RECEIVE)

Based on Layer 2 (FDL) of PROFIBUS, the CP 342-5 offers a simple, optimized interface for process or field communication.

This interface offers integrated, high-performance communication between SIMATIC S5, SIMATIC S7, SIMATIC 505 and PC. SEND/RECEIVE provides not only the SDA service (PLC/PLC connections) but also the SDN service (broadcast, multicast).

The communication partners are the automation systems:

- SIMATIC S7
  with CP 342-5, CP 343-5, CP 443-5 Extended and Basic
- SIMATIC S5
  with S5-95U with PROFIBUS interface, S5-115U/H, S5-135U, S5-155U/H with CP 5431 FMS/DP
- SIMATIC 505
  with CP 5434-FMS
- PCs
  with CP 5512, CP 5611 A2, CP 5621, CP 5613 A2, CP 5613 FO, CP 5614 A2, CP 5623, CP 5624
- Non-Siemens systems that are equipped with an FDL interface.

To use SEND/RECEIVE, function calls are required (PLC-SEND/PLC-RECEIVE), which must be linked into the STEP 7 user program.

Diagnostics

Extensive diagnostic options are available via STEP 7, including:

- Status of the CP
- General diagnostics and statistics functions
- Connection diagnostics
- Bus statistics
- Message buffer

STEP 7 V5.1 SP2 or higher, or the TIA Portal V11, is required for configuring the full functional scope of the CP 342-5. In Version V5 or higher of STEP 7, the configuration data of the CP can also optionally be stored on the CPU and is retained even if there is a power failure. A module can therefore be replaced without having to reload the configuration data from a programming device. The CPU transfers the configuration data to the CP during start-up. Attention should therefore be paid to the memory capacity of the S7-CPU.

Configuration and programming of all SIMATIC S7 controllers connected to the network is possible over the network.

The function blocks for PROFIBUS DP are included in the standard library of STEP 7. The function blocks for using the open communication (SEND/RECEIVE) and S7 communication (S7 client) can be found in the SIMATIC NET library following installation of STEP 7.

■ Overview

DP-M	DP-S	FMS	PG/OP	S7/S5	
●	●		●	●	

- PROFIBUS DP master or slave with optical interface for connecting the SIMATIC S7-300 to PROFIBUS at up to 12 Mbit/s (including 45.45 kbit/s)
- Direct connection to the optical PROFIBUS network over the integrated fiber-optic interface for plastic and PCF fiber-optic cables
- Communication services:
  - PROFIBUS DP
  - PG/OP communication (OP multiplexing)
  - S7 communication (client, server)
  - Open communication (SEND/RECEIVE)
- Easy configuration and programming over PROFIBUS
- Cross-network programming device communication through S7 routing
- Modules can be replaced without the need for a PG

■ Benefits

get Designed for Industry

- The fiber-optic technology is used when
  - the environment is subject to strong EMC interference,
  - strong potential differences exist and
  - high transmission rates are required.
- The CP 342-5 FO is connected directly to the optical PROFIBUS and is therefore specially suited to harsh industrial environments
- Expansion of the process I/O at SIMATIC S7-300 by several PROFIBUS DP interfaces
- Optimization of applications and many application options through sending of data with S7 communication
- Comprehensive control and monitoring through multiplex function with OP communication
- Suitable for closed loop control tasks due to SYNC and FREEZE

■ Application

The CP 342-5 FO is the communications processor of the SIMATIC S7-300 for the PROFIBUS DP optical bus system.

The CP 342-5 FO has a fiber optic interface that facilitates interference-immune connections even in environments with severe levels of radio interference.

It relieves the CPU of communications tasks.

Communication of the SIMATIC S7-300 with:

- the distributed I/O system ET 200 with integral optical interface
- SIMATIC S7-400 with IM 467 FO and CP 342-5 FO
- PC with CP 5613 FO
- Remaining PROFIBUS nodes via the optical bus terminal (OBT)

The number of CPs that can be used is dependent on the performance range of the CPU and on the communications services used.

■ Design

The CP 342-5 FO offers all the advantages of SIMATIC S7-300 system design:

- Compact design;
  single standard width of the SM modules of the SIMATIC S7-300
- Integrated fiber-optic cable interface;
  2 female duplex connectors for direct connection to the optical PROFIBUS over 2 x 2 male simplex connectors and 2 plug-in adapters
- 4-pin terminal block for connecting the external supply voltage of 24 V DC
- Easy installation;
  the CP 342-5 FO is snap-mounted on the S7-300 DIN rail and connected to adjacent modules through the bus connectors. There are no slot rules.
- In combination with IM 360/361, the CP 342-5 FO can also be used in an expansion rack (ER).
- User-friendly wiring;
  female FOC connector and the terminal block are easily accessible.
- The CP 342-5 FO can be operated without a fan; a back-up battery or a memory module are not required.

PROFIBUS
Communication for SIMATIC S7-300

CP 342-5 FO

■ **Function**

The CP 342-5 FO provides access to different communication services of the PROFIBUS bus system:

- PROFIBUS DP (according to IEC 61 158/61784, master or slave)
- PG/OP communication
- S7 communication
- Open communication (SEND/RECEIVE)

PROFIBUS DP master

The CP 342-5FO operates as a DP-V0 Master according to IEC 61158/EN 50 170 Volume 2 and processes the data transfer completely independently. It supports the services of the Master Classes 1 and 2.

The data areas of the distributed I/Os are transferred consistently between CP and CPU. This applies to the use of the CP as DP Master and as DP Slave. As DP Master, it permits connections to:

- The distributed IO system ET 200 with integral optical interface (incorporate as DP-V0 Slave)
- SIMATIC S7-300 with CP 342-5 FO as slave
- The remaining DP-V0 slaves via the optical bus terminal (OBT).

The CP 342-5 FO also offers the SYNC, FREEZE and shared input/output functions, as well as the activation/deactivation of slaves.

PROFIBUS DP slave

The CP 342-5 FO as a DP-V0 Slave allows the SIMATIC S7-300 to exchange data with the SIMATIC S7-400 and with other PROFIBUS DP masters via the OBT. which allows a hybrid setup between SIMATIC S5/S7, PCs, ET 200 and other field devices to PROFIBUS DP. Function calls are required for DP communication, both as master and as slave. These (DP-SEND/DP-RECV) are shipped with STEP 7 and must be integrated in the user program.

PG/OP communication

PG/OP communication allows all S7 stations connected to the network to be remotely programmed.

- S7 routing:
  With the aid of S7 routing it is possible to use programming device communication across networks.
  Via the CP 342-5 FO as many as 16 TD/OPs can be merged into one S7-300 station. This requires only one connection resource in the S7-CPU (multiplex channel). The multiplex channel supports the acyclic HMI services.

S7 communication

S7 communication is used for the coupling

- between SIMATIC S7 automation systems
- to HMI devices (OPs).
- to PCs, e.g. with CP 5512, CP 5611 A2, CP 5621 and SOFTNET-PB S7 or CP 5613 A2, CP 5613 FO, CP 5614 A2, CP 5623, CP 5624 and HARDNET-PB S7

Communication with PG and OP takes place without further configuration. In addition, the central controller can also be programmed and configured on a distributed basis via the CP 342-5 FO.

The client functionality is provided by means of loadable communication blocks.

Open communication (SEND/RECEIVE)

Based on Layer 2 (FDL) of PROFIBUS (IEC 61158/EN 50170), the CP 342-5 FO offers a simple, optimized interface for process or field communication. This interface offers integrated, high-performance communication between SIMATIC S5, SIMATIC S7, SIMATIC 505 and PC.
SEND/RECEIVE provides not only the SDA service (PLC/PLC connections) but also the SDN service (broadcast, multicast).

The communication partners are the automation systems:

- SIMATIC S7
  with CP 342-5, CP 343-5, CP 443-5 Extended and Basic
- SIMATIC S5
  with S5-95U with PROFIBUS interface, S5-115U/H, S5-135U, S5-155U/H with CP 5431 FMS/DP
- SIMATIC 505
  with CP 5434-FMS
- PCs
  CP 5512, CP 5611 A2, CP 5621, CP 5613 A2, CP 5613 FO, CP 5614 A2, CP 5623, CP 5624
- Non-Siemens systems that are equipped with an FDL interface.

To use SEND/RECEIVE, function calls are required (PLC-SEND/PLC-RECEIVE), which must be linked into the STEP 7 user program.

3

▌**Function** (continued)

Diagnostics

Extensive diagnostic options are available via STEP 7, including:

- Status of the CP
- General diagnostics and statistics functions
- Connection diagnostics
- Bus statistics
- Message buffer

STEP 7 V5.1 SP2 or higher, or the TIA Portal V11, is required for configuring the full functional scope of the CP 342-5 FO. In Version V5 or higher of STEP 7, the configuration data of the CP can also optionally be stored on the CPU and is retained

even if there is a power failure. A module can therefore be replaced without having to reload the configuration data from a programming device. The CPU transfers the configuration data to the CP during start-up. Attention should therefore be paid to the memory capacity of the S7-CPU.

Configuration and programming of all SIMATIC S7 controllers connected to the network is possible over the network.

The function blocks for PROFIBUS DP are included in the standard library of STEP 7. The function blocks for using the open communication (SEND/RECEIVE) and the S7 communication (S7 client) can be found in the SIMATIC NET library following installation of STEP 7.

PROFIBUS
Communication for SIMATIC S7-300

CP 343-5

Overview

DP-M	DP-S	FMS	PG/OP	S7/S5	
		●	●	●	

Connection of SIMATIC S7-300 to PROFIBUS at up to 12 Mbit/s (including 45.45 kbit/s)

- Communication services:
  - PG/OP communication
  - S7 communication
  - Open communication (SEND/RECEIVE)
  - PROFIBUS FMS
- Easy configuration and programming over PROFIBUS
- Can be easily integrated into the S7-300 system
- Cross-network programming device communication through S7 routing
- Modules can be replaced without the need for a PG

Benefits

- Simple integration of the SIMATIC S7 into a multi-vendor automation group by means of PROFIBUS FMS
- Extensive reduction of workload for the user of PROFIBUS FMS specification due to simple configuration and independent data conversion of data on the CP
- Sub-process-oriented design of an automation solution through the use of several CPs
- Integration of the SIMATIC S7-300 into existing systems by means of open communication
- Universal application of the CP due to the parallel use of different communication services on one CP

Application

The CP 343-5 communications processor is the module required for SIMATIC S7-300 and SIMATIC C7 for the PROFIBUS bus system.

It offloads communication tasks from the CPU.

S7-300 communication options using communication modules:

- FMS communication with PROFIBUS FMS stations through PROFIBUS
- Communication with programming devices, human machine interface devices
- Communication with other SIMATIC S7 systems
- Communication with SIMATIC S5 PLCs
- The number of CPs that can be operated depends on the performance range of the CPU and the communication services used.

Design

The CP 343-5 offers all the advantages of the SIMATIC S7-300 design:

- Compact construction;
  single standard width of the SIMATIC S7-300 SM modules
- If the adjacent module cannot be aligned without a gap when replacing earlier versions of modules, a dummy module must be used
- 9-pin Sub-D socket for the bus interface to PROFIBUS
- 4-pin terminal strip for connection of the 24 V DC external supply voltage
- Easy installation;
  the CP 343-5 is mounted on the rail of the S7-300 and connected to the adjacent modules by means of the bus connectors. For the CP 343-5 the slots 4 through 11 in module racks 0 through 3 (linked via IM 360/361) are permissible
- The CP 343-5 can also be operated in the expansion rack (ER) in conjunction with the IM 360/361
- User-friendly wiring.
  Sub-D socket and terminal strip are easily accessible
- The CP 343-5 can be operated without a fan. A back-up battery or memory module are not required.

■ Function

The CP 343-5 provides the user with various communication services of the PROFIBUS bus system:

- PG/OP communication
- S7 communication (PG, OP, S7 controllers)
- Open communication (SEND/RECEIVE)
- PROFIBUS FMS (to IEC 61158/61784)

PG/OP communication

PG/OP communication allows all S7 stations connected to the network to be remotely programmed.

- S7 routing
  With the aid of routing it is possible to use programming device communication across networks.

S7 communication

S7 communication is used for the coupling

- between SIMATIC S7 automation systems
  (CP 343-5 server only)
- to HMI devices (OPs).
- to SIMATIC 505
- to PCs, e.g. with CP 5512, CP 5611 A2, CP 5621 and SOFTNET-PB S7 or CP 5613 A2, CP 5613 FO, CP 5614 A2, CP 5623, CP 5624 and HARDNET-PB S7.

Communication with PG and OP takes place without further configuration. In addition, the central controller can also be programmed and configured on a distributed basis via the CP 343-5.

Open communication (SEND/RECEIVE)

Based on Layer 2 (FDL) of PROFIBUS (IEC 61158/61784), the CP 343-5 offers a simple, optimized interface for process or field communication.

This interface offers integrated, high-performance communication between SIMATIC S5, SIMATIC S7, SIMATIC 505 and PC. SEND/RECEIVE provides not only the SDA service (PLC/PLC connections) but also the SDN service (broadcast, multicast).

The communication partners are the automation systems:

- SIMATIC S7
  with CP 342-5, CP 343-5, CP 443-5 Extended and Basic
- SIMATIC S5
  with S5-95U with PROFIBUS interface, S5-115U/H, S5-135U, S5-155U/H with CP 5431 FMS/DP,
- SIMATIC 505 with CP 5434-FMS
- PCs with CP 5512, CP 5611 A2, CP 5621, CP 5613 A2, CP 5613 FO, CP 5614 A2, CP 5623, CP 5624
- Non-Siemens systems that are equipped with an FDL interface.

To use SEND/RECEIVE, function calls are required (PLC-SEND/ PLC-RECEIVE), which must be linked into the STEP 7 user program.

PROFIBUS FMS

PROFIBUS FMS, according to PROFIBUS IEC 61158/61784, permits the transmission of messages via various FMS services:

- READ, WRITE;
  for read or write access to variables of the communication partner from the user program (by means of a variable index or variable name),
  for the transfer of its own variable values to the communication partner. Partial access to variable values is supported.
  The communication is processed over acyclic connections (master/master, master/slave), over acyclic connections with a slave initiative and cyclic connections.
- INFORMATION REPORT;
  (Report) permits unconfirmed transmission of variables by an FMS server. This job type is used particularly for transmission on broadcast FMS connections.
- IDENTIFY;
  for requesting the identification features of the communication partner
- STATUS;
  for requesting the partner status

Diagnostics

Extensive diagnostic options are available via STEP 7, including:

- Status of the CP
- General diagnostics and statistics functions
- Connection diagnostics
- Bus statistics
- Message buffer

Configuration

STEP 7 V5.1 SP2 or higher is required for configuring the full functional scope of the CP 343-5. In Version V5 or higher of STEP 7, the configuration data of the CP can also optionally be stored on the CPU and is retained even if there is a power failure. A module can therefore be replaced without having to reload the configuration data from a programming device. The CPU transfers the configuration data to the CP during start-up. Attention should therefore be paid to the memory capacity of the S7-CPU.

Configuration and programming of all SIMATIC S7 controllers connected to the network is possible over the network.

The function blocks for using the open communication (SEND/RECEIVE) and FMS can be found in the SIMATIC NET library following installation of STEP 7.

CP 443-5 Basic

Overview

DP-M	DP-S	FMS	PG/OP	S7/S5	
		●	●	●	

- Connection of the S7-400 to PROFIBUS
- Communication services:
  - PG/OP communication
  - S7 communication
  - Open communication (SEND/RECEIVE)
  - PROFIBUS FMS
- Time synchronization
- Easy programming and configuration over PROFIBUS
- Cross-network programming device communication through S7 routing
- Can be easily integrated into the SIMATIC S7-400 system
- Modules can be replaced without the need for a PG
- SIMATIC H system operation for redundant S7 communication

Benefits

get Designed for Industry

- Simple integration of the SIMATIC S7 into a multi-vendor automation group by means of PROFIBUS FMS
- Application in fault-tolerant systems due to redundant S7 communication
- Extensive reduction of workload for the user of PROFIBUS FMS specification due to simple configuration and independent data conversion of data on the CP
- Plant-wide clock time thanks to clock synchronization
- Integration of the SIMATIC S7-400 into existing systems by means of open communication
- Universal application of the CP due to the parallel use of different communication services on one CP

Application

The CP 443-5 Basic communications processor is the module required for SIMATIC S7-400 for the PROFIBUS bus system.

It offloads communication tasks from the CPU.

Communications options of the S7-400 through communications modules:

- FMS communication with PROFIBUS stations through PROFIBUS
- Communication with programming devices, human machine interface devices
- Communication with other SIMATIC S7 systems
- Communication with SIMATIC S5 PLCs

The number of CPs that can be operated depends on the performance range of the CPU and the communication services used.

Design

The CP 443-5 communications processor features all the advantages of the SIMATIC S7-400 design:

- Compact construction;
  9-pin Sub-D socket for connection to PROFIBUS
- Single-width module
- Easy installation;
  the CP 443-5 is mounted on the S7-400 rack and connected to the other modules of the S7-400 by means of the backplane bus. No slot rules apply in this case.
- User-friendly wiring;
  the Sub-D socket is easily accessible and simple to operate.
- The CP 443-5 Basic can be operated without a fan. A backup battery or memory module is not required
- When using SEND/RECEIVE, the number of operable modules depends on the S7-400 CPU used.

■ **Function**

The CP 443-5 Basic provides access to different communication services of the PROFIBUS bus system:

- PG/OP communication
- S7 communication (S7 controllers)
- Open communication (SEND/RECEIVE)
- PROFIBUS FMS (to IEC 61158/61784)
- Time synchronization

PG/OP communication

PG/OP communication allows all S7 stations connected to the network to be remotely programmed.

- S7 routing
  With the aid of routing it is possible to use programming device communication across networks.

S7 communication

S7 communication is used for the coupling

- between SIMATIC S7 automation systems
- to programming devices (PG/OP communication)
- To PCs,
  e.g. with CP 5512, CP 5611 A2, CP 5621 and SOFTNET-PB S7 or CP 5613 A2, CP 5613 FO, CP 5614 A2, CP 5623, CP 5624 and HARDNET-PB S7
- to HMI devices (OPs).
- For redundant S7 communication, the CP 443-5 Basic can also be used in SIMATIC H systems.

Open communication (SEND/RECEIVE)

Based on Layer 2 (FDL) of PROFIBUS, the CP 443-5 Basic offers a simple, optimized interface for data communication. This interface offers integrated, high-performance communication between SIMATIC S5, SIMATIC S7 and the PC. It provides the services SDA (PLC/PLC connections) and SDN (Broadcast/Multicast).

The communication partners are the automation systems:

- SIMATIC S7
  with CP 342-5, CP 343-5, CP 443-5 Extended and Basic
- SIMATIC S5
  with S5-95U with PROFIBUS interface, S5-115U/H, S5-135U, S5-155U/H with CP 5431 FMS/DP
- SIMATIC 505
  with CP 5434-FMS
- PCs
  with CP 5512, CP 5611 A2, CP 5621, CP 5613 A2, CP 5613 FO, CP 5614 A2, CP 5623, CP 5624
- Non-Siemens systems that are equipped with an FDL interface.

To use SEND/RECEIVE, function calls are required (PLC-SEND/PLC-RECEIVE), which must be linked into the STEP 7 user program.

PROFIBUS FMS

PROFIBUS FMS, according to IEC 61158/61784, permits the transmission of messages via various FMS services:

- READ, WRITE;
  for read or write access to variables of the communication partner from the user program (by means of a variable index or variable name), for the transfer of its own variable values to the communication partner.
  Partial access to variables is supported. The communication takes place over acyclic connections (master/master, master/slave), over acyclic connections with a slave initiative and cyclic connections (master/slave).
- INFORMATION REPORT;
  (Report) permits unconfirmed transmission of variables by an FMS server. This job type is used particularly for transmission on broadcast FMS connections.
- IDENTIFY;
  for requesting the identification features of the communication partner
- STATUS;
  for requesting the partner status

Time synchronization

The CP 443-5 Basic is capable of forwarding the time of day of the S7-400 CPU to PROFIBUS. Conversely, the CP 443-5 Basic of the S7-400 CPU can make an existing time of day available on the PROFIBUS.

Diagnostics

Extensive diagnostic options are available via STEP 7, including:

- Status of the CP
- General diagnostics and statistics functions
- Connection diagnostics
- Bus statistics
- Message buffer

Configuration

STEP 7 V5.1 SP2 or higher is required for configuring the full functional scope of the CP 443-5 Basic. In Version V5 or higher of STEP 7, the configuration data of the CP can also optionally be stored on the CPU and is retained even if there is a power failure. A module can therefore be replaced without having to reload the configuration data from a programming device. The CPU transfers the configuration data to the CP during start-up.

Configuration and programming of all SIMATIC S7 controllers connected to the network is possible over the network.

The function blocks for using the open communication (SEND/RECEIVE) can be found in the SIMATIC NET library following installation of STEP 7.

PROFIBUS
Communication for SIMATIC S7-400

CP 443-5 Extended

■ Overview

DP-M	DP-S	FMS	PG/OP	S7/S5	
●			●	●	

- PROFIBUS DP master with electrical interface for connecting the SIMATIC S7-400 to PROFIBUS at up to 12 Mbit/s (including 45.45 kbit/s)
- For setting up additional PROFIBUS DP lines
- Communication services:
  - PROFIBUS DP
  - PG/OP communication
  - S7 communication
  - Open communication (SEND/RECEIVE)
- Time synchronization
- Easy programming and configuration over PROFIBUS
- Cross-network programming device communication through S7 routing
- Can be easily integrated into the SIMATIC S7-400 system
- Module replacement without PG
- SIMATIC H system operation for redundant S7 communication or DP master communication
- Data record routing (PROFIBUS DP)
- Adding or modifying distributed I/O during operation

■ Benefits

- Increased plant availability thanks to redundant connection of the process I/O (e.g. ET 200M) in the SIMATIC S7-400 H system
- Particularly suitable for closed-loop control tasks thanks to SYNC/FREEZE and equidistant bus cycle
- Sub-process-oriented design of an automation solution through the use of several CPs
- Universal application of the CP due to the parallel use of different communication services on one CP
- Lower costs due to flexible and reaction-free commissioning by means of CiR (Configuration in RUN)

■ Application

The CP 443-5 Extended is the communications processor of the SIMATIC S7-400 for the PROFIBUS bus system.

It relieves the CPU of communication tasks and supports additional connections.

Communication possibilities of the S7-400 using communication modules:

- As master for PROFIBUS DP according to IEC 61158/EN 50170
- Communication with programming devices and HMI devices
- Communication with other SIMATIC S7 systems
- Communication with SIMATIC S5 programmable controllers

The number of CPs that can be used is dependent on the performance range of the CPU and on the communications services used.

■ Design

The CP 443-5 Extended communications processor features all the advantages of the SIMATIC S7-400 design:

- Compact construction;
  9-pin Sub-D socket for connection to PROFIBUS DP
- Single-width module
- Easy installation;
  the CP 443-5 is mounted on the S7-400 rack and connected to the other modules of the S7-400 by means of the backplane bus.
- User-friendly wiring;
  the Sub-D socket is easily accessible and simple to operate.
- The CP 443-5 Extended can be operated without a fan.
  A backup battery or memory module is not required
- A maximum of 14 CPs can be operated.

If the CP 443-5 Extended is used as a DP Master, at least four and as many as 10 additional PROFIBUS DP lines can be set up in the central rack. The number of possible PROFIBUS DP lines depends on the SIMATIC S7-400 CPU that is used.

When using S7-communication, no slot allocation rules apply. The number of operable S7 connections depends on the S7-400 CPU.

When using SEND/RECEIVE, the number of operable modules also depends on the S7-400 CPU.

■ Function

The CP 443-5 Extended provides access to different communication services of the PROFIBUS bus system:

- PROFIBUS DP (according to IEC 61158/61784)
- PG/OP communication
- S7 communication (S7 controllers)
- Open communication (SEND/RECEIVE)
- Time synchronization

Master for PROFIBUS DP

The CP 443-5 Extended operates as DP-V1 master. It processes data transfer autonomously and allows slaves to be connected, such as CP 342-5 as DP slave, DP slaves of the ET 200 distributed I/O system, etc. This means that the CP 443-5 Extended is able to connect the S7-400 station to PROFIBUS DP and is the ideal expansion to the integral DP master interfaces of the S7-400 CPUs for establishing additional PROFIBUS DP lines.

The CP 443-5 Extended can also be used in the SIMATIC S7 H system as a redundant DP master.

The CP 443-5 Extended is a DP-V1 master, i.e. it also supports the acyclic standard services incl. interrupt handling.

The CP 443-5 Extended also supports the SYNC and FREEZE functions, constant bus cycle time, direct slave-to-slave traffic, data set routing and changes to the configuration of the assigned distributed I/O during normal operation.

During normal operation, it is also possible to activate or deactivate DP slaves. This supports the step-by-step start-up of subprocesses, for example.

A diagnostic repeater allows the line to be diagnosed during operation, enabling line faults to be detected at an early stage. The CP 443-5 Extended supports operation with diagnostic repeater (including activation of topology identification in the diagnostic repeater).

The distributed I/Os are handled like central I/Os from the user's point of view. This means that there are no differences between the CP 443-5 Extended and the integral DP master interface of the S7-400 CPU with regard to configuration and parameterization. Depending on the scale of the system, the CP 443-5 Extended has extremely short response times.

PG/OP communication

PG/OP communication allows all S7 stations connected to the network to be remotely programmed.

- S7 routing
  With the aid of routing it is possible to use programming device communication across networks.

S7 communication

S7 communication is used for the coupling

- between SIMATIC S7 automation systems
- to programming devices (PG/OP communication)
- to PCs,
  e.g. with CP 5512, CP 5611 A2, CP 5621 and SOFTNET-PB S7 or CP 5613 A2, CP 5613 FO, CP 5614 A2, CP 5623, CP 5624 and HARDNET-PB S7
- to HMI devices (OPs).

For redundant S7 communication, the CP 443-5 Extended can also be used in SIMATIC H systems.

Open communication (SEND/RECEIVE)

SIMATIC S7-400 is integrated into existing systems by means of open communication.

Based on Layer 2 (FDL) of PROFIBUS, the CP 443-5 Extended offers a simple, optimized interface for process or field communication. This interface offers uniform, high-performance communication between SIMATIC S5, SIMATIC S7 and the PC. It provides the services SDA (PLC/PLC connections) and SDN (Broadcast, Multicast).

The communication partners are the programmable controllers

- SIMATIC S7
  with CP 342-5, CP 343-5, CP 443-5 Extended and Basic
- SIMATIC S5
  with S5-95U with PROFIBUS interface, S5-115U/H, S5-135U, S5-155U/H with CP 5431 FMS/DP
- SIMATIC 505
  with CP 5434-FMS
- PCs
  with CP 5512, CP 5611 A2, CP 5621, CP 5613 A2, CP 5613 FO, CP 5614 A2, CP 5623, CP 5624
- Non-Siemens systems that are equipped with an FDL interface.

To use SEND/RECEIVE, function calls are required (PLC-SEND/ PLC-RECEIVE), which must be linked into the STEP 7 user program.

3

CP 443-5 Extended

Function (continued)

Time synchronization

Time synchronization is used to define plant-wide time-of-day.

The CP 443-5 Extended is capable of forwarding the time of day of the S7-400 CPU to PROFIBUS. Conversely, the CP of the S7-400 CPU can make an existing time of day available on PROFIBUS.

The CP 443-5 Extended supports

- The time-stamping of distributed process signals in combination with IM 153
- Time status value, daylight-saving time changeover, synchronization status

Data set routing

The CP 443-5 Extended supports the data set routing function. With this option, the CP can be used as a router for data sets that have to be sent to field devices (DP slaves). SIMATIC PDM (Process Device Manager) is a tool that creates data sets of this type for parameterizing and diagnosing field devices.

Application:
It is possible, for example, to use SIMATIC PDM (on the PC) to set parameters and perform diagnostics for a PA field device over Industrial Ethernet, S7-400 (CP 443-1, CP 443-5 Extended) and DP/PA Coupler/Link.

Diagnostics

Extensive diagnostic options are available via STEP 7, including:

- Status of the CP
- General diagnostics and statistics functions
- Connection diagnostics
- Bus statistics
- Message buffer
- Support of operation with diagnostic repeater

CiR – Configuration in RUN

With CiR, it is possible to add or modify distributed I/O devices during normal operation.

- Adding PROFIBUS DP/PA slaves
- Adding/removing modules (e.g. I/O modules) in a modular DP slave (e.g. ET 200M and DP/PA Link)

Configuration

STEP 7 V5.1 SP2 or higher, or the TIA Portal V11, is required for configuring the full functional scope of the CP 443-5 Extended.

DP configuration/programming is performed for the CP 443-5 Extended in the same manner as for DP configuration/programming of the integrated DP interfaces of the SIMATIC S7-400 CPUs with STEP 7.

The configuring data of the CPs are always saved on the CPU and are retained even after a PLC failure. A module can therefore be replaced without having to reload the configuration data from a programming device. The CPU transfers the configuration data to the CP during start-up.

Configuration and programming of all SIMATIC S7 controllers connected to the network is possible over the network.

The function blocks for using the open communication (SEND/RECEIVE) can be found in the SIMATIC NET library following installation of STEP 7.

SIPLUS CP 443-5 Extended

■ **Overview**

DP-M	DP-S	FMS	PG/OP	S7/S5	
●			●	●	

- DP-V1 master connection of the S7-400 to PROFIBUS
- For setting up additional PROFIBUS DP lines
- Communication services:
  - PROFIBUS DP
  - PG/OP communication
  - S7 communication
  - S5-compatible communication (SEND/RECEIVE)
- Clock synchronization
- Easy programming and configuration over PROFIBUS
- Cross-network programming device communication through S7 routing
- Can be easily integrated into the SIMATIC S7-400 system
- Module replacement without PG
- SIMATIC H system operation for redundant S7 communication or DP master communication
- Data record routing (PROFIBUS DP)
- Adding or modifying distributed I/O during operation

Note:

SIPLUS extreme products are based on Siemens Industry standard products. The contents listed here were taken from the respective standard products. SIPLUS extreme-specific information was added.

SIPLUS CP 443-5-Extended	
Order number	**6AG1 443-5DX04-4XE0**
Order No. based on	**6GK7 443-5DX04-0XE0**
Ambient temperature range	0 ... +60 °C
Conformal coating	Coating of the printed circuit boards and the electronic components
Technical data	The technical data of the standard product applies except for the ambient conditions
Ambient conditions	
Relative humidity	5 ... 100 % Condensation permissible
Biologically active substances	Conformity with EN 60721-3-3, Class 3B2 mold and fungal spores (except fauna)
Chemically active substances	Conformity with EN 60721-3-3, Class 3C4 incl. salt mist and ISA–S71.04 severity level G1; G2; G3; GX [1] [2]
Mechanically active substances	Conformity with EN 60721-3-3, Class 3S4 including conductive sand, dust [2]
Air pressure (depending on the highest positive temperature range specified)	1080 ... 795 hPa (-1000 ... +2000 m) see ambient temperature range
	795 ... 658 hPa (+2000 ... +3500 m) derating 10 K
	658 ... 540 hPa (+3500 ... +5000 m) derating 20 K

[1] ISA-S71.04 severity level GX: Long-term load:
SO_2 < 4.8 ppm; H_2S < 9.9 ppm; Cl < 0.2 ppm; HCl < 0.66 ppm; HF < 0.12 ppm; NH < 49 ppm; O_3 < 0.1 ppm; NOX < 5.2 ppm
Limit value (max. 30 min/d):
SO_2 < 17.8 ppm; H_2S < 49.7 ppm; Cl < 1.0 ppm; HCl < 3.3 ppm; HF < 2.4 ppm; NH < 247 ppm; O_3 < 1.0 ppm; NOX < 10.4 ppm

[2] The supplied plug covers must remain in place over the unused interface when operated in atmospheres containing corrosive gases!

Communication for SIMATIC S7-mEC with CP 5603

see page 3/189 and the following

PROFIBUS
System interfaces for PG/PC/IPC
Communication for PC-based systems
Overview

3

Overview

System connection for PG/PC/IPC

PC card with an internal microprocessor

Recommended solution for:

- PC-based control systems
  (Soft Control, PLC, Numeric Control, Robot Control)
- Process control systems
- Operator control and monitoring systems (HMI)
- PROFIBUS DP slave interface (CP 5614 A2)
- PROFIBUS plants with large quantity framework (more than 8 stations)
- Multi-protocol operation
- Use of several CPs in one system
- Designs with fiber-optic interface (FO)

PC card without an internal microprocessor

Recommended solution for:

- Configuring tools (e.g. STEP 7)
- PROFIBUS DP diagnostics station
  (e.g. with COM PROFIBUS or as DP master Class 2)
- PROFIBUS DP slave connection
- PROFIBUS systems with up to 8 stations
- Mono protocol mode

The software section lists: Software, Hardware.

- You will find software for the PC products running under Windows with the corresponding authorization diskettes on the SIMATIC NET software CD.
- Development Kits are available for use in various operating system environments (e.g. for CP 5613 A2 or CP 5614 A2).
- As a rule, the necessary configuration tools are included in the software packages.
- Manuals in PDF format and extensive supplementary information on SIMATIC NET products and communication can be found in the SIMATIC NET Manual Collection which is enclosed with the software products.

SIMATIC NET Manual Collection

CPs with an internal microprocessor: CP 5613 A2 (PCI) CP 5623 (PCIe); CP 5614 A2 (PCI) CP 5624 (PCIe)

CPs without an internal microprocessor: CP 5611 A2 (PCI) CP 5621 (PCIe); CP 5603; CP 5512 (PC-Card, CardBus); CP 5711 (USB V2.0)

Overview

The following communications processors are available for connecting to the programming device or PC:

- CPs with an internal microprocessor:
  CP 5613 A2 (PCI), CP 5613 FO (PCI), CP 5614 A2 (PCI), CP 5623 (PCIe), CP 5624 (PCIe)
- CPs without an internal microprocessor:
  CP 5512 (PC Card/CardBus), CP 5611 A2 (PCI), CP 5621 (PCIe), CP 5711 (USB)

Performance of PROFIBUS CPs

The maximum performance specifies how much digital input/output data can be read or written in 1 ms from the PROFIBUS application over the respective PROFIBUS CP (regardless of the physical characteristics of the bus).

Performance under almost identical CPU loading

CPU loading and access time

If event access (using interrupts) and polling access are compared, it can be shown that the CPU loading can be significantly reduced with the CP 5613 A2 using the event/filter mechanism – for the same data throughput.

Comparison of loading on the CPU with event access and with polling access

Performance data of PROFIBUS CPs

		CP 5613 A2/ CP 5613 FO	CP 5614 A2	CP 5512/ CP 5611 A2/ CP 5621
Number of connectable DP slaves	Max.	122	122	60
Number of FDL tasks waiting	Max.	120	120	100
Number of PG/OP and S7 connections	Max.	50 [1]	50 [1]	8
Number of FMS connections	Max.	40 [2]	40 [2]	-

Note:
[1] for credit = 1; PDU size ≤ 480 bytes
[2] for credit = 1; max. 2 x CP 5613 A2 / CP 5613 FO / CP 5614 A2

Configuration with NCM PC

The PC can be configured either in STEP 7 or in NCM PC Version V5.1+SP2 and higher. Both tools offer the same look and feel and create the same database. This means that uniform configuration is possible for the communication functions open communication, S7 communication and for the DP protocol and FMS protocol. Data only has to be entered once and data consistency is assured.

- With NCM PC and STEP 7 from Version V5.1+SP2 upwards, a PC similar to a SIMATIC S7 station can be configured and loaded over a network. This applies both to the local station on which NCM PC or STEP 7 is installed and to the remote station that is addressed over the network.

Note:
NCM PC does not contain a conversion function for LDBs that were created using COML S7. Reconfiguration is necessary.

1) In order to use these CPs in other operating system environments, it is required to port HARDNET DP Development Kits (DK-5613) into the respective operating system. You can request the HARDNET DP DK in the Internet under www.siemens.com/simatic-net/dk5613.
2) integrated PROFIBUS interface is optional
3) depending on available memory and processor performance there could be restrictions
4) depending on the slots of the selected PC version
5) EM-PCI 104 expansion module is required

Notes
- Please always note the supplementary conditions for the specified SIMATIC NET products that you can view on the Internet pages shown below.
- for further details on XP embedded, see http://support.automation.siemens.com/WW/view/de/21661049
- further details on system requirements and operating environments can be found in the Readme file of the communication products on the SIMATIC NET PC Software CD V8.1
- Updates and supplements to the catalog entries, as well as the above tables can be viewed at http://www.siemens.com/simatic-net/ik-info

● suitable
− not suitable
○ suitable under certain conditions

G_IK10_XX_50025

Note:
The operating systems listed refer exclusively to the communication products specified!

For the actual operating system that is available and has been released, please refer to the description of the corresponding IPC.

■ Overview

DP-M	DP-S	FMS	OPC	PG/OP	S7/S5
●	●	●	●	●	●

- PCI-104 interface card with own microprocessor for connecting embedded systems with PCI-104 interface to PROFIBUS at up to 12 Mbit/s
- Function compatible with CP 5613 A2
- Communication services:
  - PROFIBUS DP master Class 1 and 2 or DP slave according to IEC 61158/61784
  - PG/OP communication with STEP 5 and STEP 7
  - S7 communication with HARDNET-PB S7 software package
  - Open communication (SEND/RECEIVE) based on the FDL interface
  - PROFIBUS FMS according to IEC 61158/61784 with FMS-5613 software package
- Extensive diagnostics options for installation, commissioning and operation of the module
- Event and filter mechanism for reducing the load on the host CPU
- Multiprotocol operation and parallel operation of up to three CPs
- The appropriate OPC server and configuration tools are included in the scope of delivery of the respective communication software
- Linux-based development kit with driver sources for integration into "non-Windows" environments

Note:

FMS-5613 supports up to two CP 5603/CP 5613 A2/5614 A2/ CP 5623/CP 5624 processors

■ Benefits

g **e** **get** **Designed for Industry**

- Fast process data exchange;
  access to process data by means of direct access to the dual port RAM of the hardware
- High computing performance in the PG/PC;
  reduces workload of host CPU by preprocessing the communication on the hardware
- Use of different operating system environments;
  driver as source code for porting to different operating system environments
- Use also in motion control applications;
  real-time capable data exchange through constant bus cycle time

■ Application

The CP 5603 allows the connection of embedded systems with a PC/104 Plus interface to PROFIBUS.

The CP 5603 also provides high-performance support to control tasks on the embedded system (PC-based Control, Numeric Control, Robot Control).

PROFIBUS
Communication for PC-based systems

CP 5603

3

■ Function

PROFIBUS DP

Access to process data with DP-Base

The CP 5603 is operated as PROFIBUS DP master module that keeps the process image (input/output and diagnostics data) in the dual port RAM (memory area on the CP). The hardware of the CP 5603 independently executes the high-performance exchange of data with the PROFIBUS slaves. The user accesses the Dual Port RAM directly.
The process data of the slaves is always consistent, i.e. the user receives the data of a slave from one and the same DP cycle.

Parallel operation of the HARDNET-PB S7 and DP-Base software is not possible.

Event filter mechanism

The user receives up-to-date data over two access mechanisms:

- Cyclic polling of the DP slaves (higher loading for host CPU)
- Notification by innovative event/filter mode when changing the input data of a slave (minimum loading for host CPU)

The two alternatives can also be combined. This allows users to optimize the PC to their applications.

The event/filter mechanism can be used additionally for

- Notification by means of an interrupt of the diagnostic messages from slaves
- In equidistance mode, signaling by means of interrupt:
  - Start DP cycle
  - End of cyclic data exchange with the DP slaves

FastLogic

FastLogic means that the CP 5603 can react autonomously to as many as 4 plant statuses. This results in a short response time and independence from the host application, e.g. fast shutdown of devices.

DP programming interface

The DP programming interface (DP-Base) of the CP 5603 has the following functionality:

- DP-Master Class 1 including acyclic DP expansions
- DP-Master Class 2 including acyclic DP expansions
- DP slave

The process data is accessed directly via the dual port RAM. The DP RAM interface not only offers fast access as DP master/slave but also a basis for porting to other operating system environments (e.g. VXWorks, QNX, RMOS, RTX).

Administrative function calls (initialization and management services, as well as diagnostic functions) are provided through a library (DP_BASE.DLL or DPS_BASE.DLL).

HARDNET-PB DP Development Kit

The HARDNET-PB DP Development Kit provides access to the functions DP master Class 1 including acyclic DP expansions

The HARDNET DP Development Kit software enables the CP 5603 communications processor to be integrated into any operating system environments. The kit contains the necessary source code, including the descriptions in PDF format, and can be downloaded free of charge from the Internet.

Access to process data with HARDNET-PB DP

DP Master Class 1

The CP 5603 operates as a DP Master Class 1 according to IEC 61158/61784 and processes the data transfer with the distributed stations (DP slaves) completely autonomously. The central controller exchanges information with the DP slaves (e.g. ET 200S) in a specified, constantly repeating message cycle. The DP programming interface (DPLib.DLL) provides the PC programmer with function calls for data exchange. The DP interface also provides the SYNC and FREEZE functions as well as activation and deactivation of slaves.

The DP function expansions relating to Master Class 1 make it possible to perform acyclic read and write functions (DS_READ, DS_WRITE) as well as acknowledgement of alarms (ALARM_ACK) at the same time as processing cyclic data communication. Data that are to be transferred in acyclic mode (e.g. parameterization data) are only rarely changed in comparison to the cyclic measured values, and are transferred at lower priority in parallel with the cyclic high-speed user data transfer. The alarm acknowledgment at the Master safeguards the transmission of the alarms from DP slaves.

Parallel operation of the DP-Base and HARDNET-PB DP software is not possible.

DP Master Class 2

In addition to the DP Master Class 1 services, the CP 5603 (in combination with the DP programming interface) also offers DP master class 2 services according to IEC 61158/61784. Devices of this type (programming devices, configuring devices, or operator panels) are used during the commissioning and for configuring the DP system, or for operating the system while it is running (diagnostics). The DP programming interface provides the following services:

- Master diagnosis
- Slave diagnosis
- Reading the input/output of a slave
- Reading configuration data
- Changing slave address

The extended DP functions comprise acyclic access to the parameters and measured values of a slave (e.g. field devices of process automation and intelligent HMI devices). This type of slave must be supplied with extensive parameter data during start-up and during normal operation (DS_READ, DS_WRITE).

■ **Function** (continued)

PROFIBUS DP connection with embedded PC SIMATIC Microbox

Software for PG/OP communication

This software allows the programming of SIMATIC S5/S7 controllers (except for SIMATIC S5-95U) via PROFIBUS in combination with STEP 5/STEP 7. The PG/OP communication for the CP 5603 is already available after installation of the CP 5603 (DP base). No additional software package is necessary.

Open communication (SEND/RECEIVE based on the FDL interface)

SEND/RECEIVE (FDL interface) is already available following installation of the CP 5603 (DP-Base) and provides services for data transfer, diagnostics and management. No additional software package is necessary.

Software for S7 communication (HARDNET-PB S7)

SIMATIC S7 system components communicate with each other using S7 communication functions. The S7 programming interface provides PG/PC user programs with access to SIMATIC S7 system components. This provides easy, flexible access to the data of the SIMATIC S7.

The S7 communication provides the following services:

Administrative services
- Connection management
- Mini database
- Trace

Data transfer services
- Read/write variables
- BSEND/BRECEIVE (up to 64 KB per task)

PROFIBUS
Communication for PC-based systems

CP 5603

Function (continued)

Software for PROFIBUS FMS (FMS-5613)

With the FMS programming interface, PGs/PCs can exchange different manufacturer data with FMS-capable controllers (e.g. S5 and S7) and field devices. Open communication is assured by using the FMS interface.

The FMS interface offers the following services:

- Administrative services
- CRL management services
- FMS connection management services

- Object directory management services for clients and server
- Variable services for clients and servers (Read, Write, Information Report)
- Server functionality
- VFD (Virtual Field Device) services for clients and servers
- Bus access information services (live list)
- Trace and mini-database

Connecting the SIMATIC to the S7 modular embedded controller via PROFIBUS

User interfaces

OPC interface

The OPC server included in the respective software package can be used as the standard programming interface for the PROFIBUS DP, open communication, S7 communication and PROFIBUS FMS for linking automation technology applications to OPC-capable Windows applications (Office, HMI systems, etc.).

Programming interface via C-Library

The programming interfaces for existing applications are implemented as Dynamic Link Libraries (DLL). The released compilers can be found in the readme file of the SIMATIC NET CD products at www.siemens.com/automation/csi/net.

For Borland programming interfaces (e.g. DELPHI), partner solutions from SoftwareOption are offered.

For solutions for other operating systems, see HARDNET-PB DP Development Kit.

Configuration

- The S7 communication protocol, open communication protocol, DP protocol (DP-V0/DP-V1/DP-V2) and FMS protocol are configured in STEP 7 or NCM PC V5.1 +SP2.
- The configuration tool NCM PC is included in the PROFIBUS software packages.

Diagnostics

Comprehensive diagnostic tools are available (for installation, start-up and operation) for the module itself and for the PROFIBUS DP network. These tools can be used for quick and easy start-up of a PROFIBUS network with a CP 5603.

Technical specifications

Order No.	6GK1 560-3AA00
Product type designation	**CP 5603**
Data transmission rate	
Transmission rate at interface 1 in accordance with PROFIBUS	9.6 kbit/s to 12 Mbit/s
Interfaces	
Number of electrical connections at interface 1 in accordance with PROFIBUS	1
Design of electrical connection	
• at interface 1 in accordance with PROFIBUS	9-pin D-sub socket (RS 485)
• of the backplane bus	PCI-104 (32 bit)
Supply voltage, current consumption, power loss	
Type of power supply	DC
Supply voltage 1 from backplane bus	5 V
Relative symmetric tolerance at 5 V DC	5 %
Current consumption 1 from backplane bus with DC, maximum	0.66 A
Effective power loss	3.3 W
Permitted ambient conditions	
Ambient temperature	
• During operation	0 … 70 °C
• During storage	-40 … +70 °C
• During transport	-40 … +70 °C
Relative humidity at 25 °C without condensation during operation, maximum	85 %
IP degree of protection	IP00
Design, dimensions and weights	
Module format	PCI -104
Width	90 mm
Height	21 mm
Depth	96 mm
Net weight	80 g
Type of mounting	Screw mounting
Product properties, functions, components General	
Number of plug-in cards of same design which can be inserted per PC station	3
Number of modules - Note	FMS-5613 supports a maximum of two CP 5603 / CP 5613 A2 / CP 5614 A2 / CP 5623 / CP 5624 processors
Performance data	
Performance data Open communication	
Software required for open communication by means of SEND/RECEIVE	FDL driver included in scope of delivery of CP
Number of possible connections for open communication by means of SEND/RECEIVE, maximum	80
Performance data PROFIBUS DP	
Software required for DP master function	No
Service as DP master	
• DPV0	Yes
• DPV1	Yes
• DPV2	Yes

Order No.	6GK1 560-3AA00
Product type designation	**CP 5603**
Number of DP slaves operable on DP master	124
Data volume	
• of address area of inputs as DP master, total	30 256 bytes
• of address area of outputs as DP master, total	30 256 bytes
• of address area of inputs per DP slave	244 bytes
• of address area of outputs per DP slave	244 bytes
• of address area of diagnostics data per DP slave	244 bytes
Software required for DP slave function	No
Service as DP slave	
• DPV0	Yes
• DPV1	Yes
Data volume	
• of address area of inputs as DP slave, total	244 bytes
• of address area of outputs as DP slave, total	244 bytes
Performance data FMS functions	
Software required for FMS communication	Yes, FMS-5613
Number of possible connections with FMS connection, maximum	40
Performance data S7 communication	
Software required for S7 communication	Yes, HARDNET-PB S7 (S7-5613)
Number of possible connections for S7/PG communication, maximum	50
Performance data Multiprotocol operation	
Number of active connections for multiprotocol operation	50
Number of configurable connections per PC station	207
Product functions Management, configuration, programming	
Configuration software required	NCM PC included in scope of delivery
Product functions Diagnostics	
Product function: Port diagnostics	Yes
Standards, specifications, approvals	
Standard	
• For EMC	2004/108/EC
• For CSA and UL safety	CAN/CSA C22.2 & UL 60950-1, UL 508
• For emitted interference	EN 61000-6-3, EN 61000-6-4
• For noise immunity	EN 61000-6-1, EN 61000-6-2
Certificate of suitability	
• CE mark	Yes
• C-Tick	Yes
Accessories	
Accessories	Optional: Expansion frame for SIMATIC Microbox and withdrawable drawer for SIMATIC S7 modular embedded controller

PROFIBUS
Communication for PC-based systems

CP 5603

Ordering data	Order No.
CP 5603 communications processor	**6GK1 560-3AA00**
PCI-104 card for connection to PROFIBUS incl. DP-Base software with NCM PC; DP-RAM interface for DP master or DP slave, incl. PG and FDL protocols; single license for one installation, runtime software, software and electronic manual on CD-ROM, Class A, for operating system support see SIMATIC NET software; German/English	
Software upgrade	**6GK1 561-3AA01-3AE0**
For CP 5603, CP 5613 A2 and CP 5623 to Edition 2008 or V8.1	
CP 5603 Microbox Package	**6GK1 560-3AU00**
For use of CP 5603 in Microbox 420/427B/427C; consisting of CP 5603 module and Microbox expansion frame	
CP 5603 expansion rack	**6GK1 560-3AA00-0AU0**
For use in Microbox 420/427B/427C with mounting material	
CP 5603 mEC Package	**6GK1 560-3AE00**
For use of CP 5603 in SIMATIC S7-MEC; consisting of CP 5603 and withdrawable unit for CP 5603 for installation in the EM PCI-104 expansion module of the SIMATIC S7-MEC	
CP 5603 insert plate	**6GK1 560-3AA00-0AE0**
Metal plate with RS485 cutout for inserting for the S7 modular embedded controller	
HARDNET-PB DP Development Kit	See www.siemens.com/simatic-net/dk5613
HARDNET-PB DP Development Kit software for CP 5603, CP 5613, CP 5613 A2, CP 5623, CP 5613 FO, CP 5614, CP 5614 A2, CP 5624; for integration into other operating system environments on systems with a PCI slot

- PCI card (universal keyed 5 V/3.3 V) with own microprocessor for connection of PCs and SIMATIC PG/PC to PROFIBUS at up to 12 Mbit/s
- Communication services:
  - PROFIBUS DP master according to IEC 61158/61784 on a PCI card
  - PG/OP communication with STEP 5 and STEP 7
  - S7 communication with HARDNET-PB S7 software package
  - Open communication (SEND/RECEIVE) based on the FDL interface
  - PROFIBUS FMS according to IEC 61158/61784 with FMS-5613 software package
- Comprehensive diagnostics possibilities for installation, commissioning and operation of the module
- High performance over direct dual-port RAM access
- Event and filter mechanisms to reduce the loading on the host CPU
- Multiprotocol operation and parallel operation of up to four CPs
- Implementation in Motion Control applications is possible because a constant bus cycle time is supported
- The appropriate OPC servers and configuration tools are included in the scope of supply of the respective communications software.

Benefits

- Fast process data exchange; access to process data by means of direct access to the dual port RAM of the hardware
- High computing performance in the PG/PC; reduces workload of host CPU by preprocessing the communication on the hardware
- Use of different operating system environments; driver as source code for porting to different operating system environments
- Use also in motion control applications; real-time capable data exchange through constant bus cycle time

Application

The CP 5613 A2 supports the connection of a SIMATIC PG/PC and PCs with a PCI slot to PROFIBUS.

The CP 5613 A2 provides high-performance support for control tasks on the PC (PC based Control, Numeric Control, Robot Control).

Design

- Short PCI card
- Operation possible in 3.3V and 5V PCI slots (universal keyed)
- 33 MHz or 66 MHz PCI clock
- Operation possible as 32-bit card in a 64-bit PCI X-slot
- 9-pin sub-D socket for connection to PROFIBUS
- Diagnostics LEDs
- Parallel operation of up to four CPs [1]

The module is installed by means of PCI standard mechanisms (Plug&Play).

If the CP 5613 A2 is used as DP master or in a PG/OP on a PROFIBUS DP, the connection is made

- **to the electrical PROFIBUS** via
  - Bus connector and PROFIBUS bus cable or
  - bus terminal (e.g. bus terminal 12M) and PROFIBUS bus cable
- **to the optical PROFIBUS with OLM** via
  - bus cable with two bus connectors or
  - PROFIBUS plug-in cable 830-1T
- **to the optical PROFIBUS with OBT and integrated interface** via
  - bus cable with two bus connectors or
  - PROFIBUS plug-in cable 830-1T

[1] FMS-5613 supports up to two CP 5603/CP 5613 A2/5614 A2/ CP 5623/CP 5624 processors.

PROFIBUS
Communication for PC-based systems

CP 5613 A2

3

■ **Function** (continued)

Software for PG/OP communication

This software supports programming of the SIMATIC S5/S7 controllers (with the exception of SIMATIC S5-95U) over PROFIBUS in combination with STEP 5/STEP 7. PG/OP communication for the CP 5613 is already available after the CP 5613 A2 (DP-Base) has been installed. No additional software packages are required.

Open communication
(SEND/RECEIVE based on the FDL interface)

SEND/RECEIVE (FDL interface) is already available following installation of the CP 5613 A2 (DP-Base) and provides services for data transfer, diagnostics and management. No additional software packages are required.

Software for S7 communication (HARDNET-PB S7)

SIMATIC S7 system components communicate with each other using S7 communication functions. The S7 programming interface provides programming device/PC user programs with access to SIMATIC S7 system components. This provides easy, flexible access to the data of the SIMATIC S7 controller.

The following services are available with S7 communication:

Administrative services

- Connection management
- Mini database
- Trace

Data transfer services

- Read/write variables
- BSEND/BRECEIVE (up to 64 KB per task)

Software for PROFIBUS FMS (FMS-5613)

With the FMS programming interface, PGs/PCs can exchange different manufacturer data with FMS-capable controllers (e.g. S5 and S7) and field devices. Open communication is assured by using the FMS interface.

The FMS interface offers the following services:

- Administrative services
- CRL management services
- FMS connection management services
- Object directory management services for clients and server
- Variable services for clients and servers (Read, Write, Information Report)
- Server functionality
- VFD services (Virtual Field Device) for clients and servers
- Bus access information services (Live list)
- Trace and mini database

User interfaces

OPC interface

The OPC server included in the respective software package can be used as the standard programming interface for the PROFIBUS DP, open communication, S7 communication and PROFIBUS FMS protocols for linking automation technology applications to OPC-capable Windows applications (Office, HMI systems, etc.).

Programming interface through C library

The programming interfaces for existing applications are implemented as Dynamic Link Libraries (DLL). You can find the released compilers in the Readme file of the SIMATIC NET CD products at www.siemens.com/automation/csi/net.

For Borland programming interfaces (e.g. DELPHI), partner solutions from SoftwareOption are offered.

For solutions for other operating systems, see HARDNET-PB DP Development Kit.

Configuration

- S7 communication protocol, open communication protocol, DP protocol (DP-V0/DP-V1/DP-V2) and FMS protocol are configured in STEP 7 or NCM PC V5.1+SP2 and higher.
- The configuration tool NCM PC is included in the PROFIBUS software packages.

Diagnostics

Comprehensive diagnostic tools are available (for installation, start-up and operation) for the module itself and for the PROFIBUS DP network. These tools can be used for quick and easy start-up of a PROFIBUS network with a CP 5613 A2.

PROFIBUS
Communication for PC-based systems

CP 5614 A2

Overview

DP-M	DP-S	FMS	OPC	PG/OP	S7/S5
●	●	●	●	●	●

- PCI card (universal keyed 5 V/3.3 V) with own microprocessor for connection of PCs and SIMATIC PG/PC to PROFIBUS at up to 12 Mbit/s
- Communication services:
  - PROFIBUS DP master and slave interface according to IEC 61158/61784 on one PCI card
  - PG/OP communication with STEP 5 and STEP 7
  - S7 communication with HARDNET-PB S7 software package
  - Open communication (SEND/RECEIVE) based on the FDL interface
  - PROFIBUS FMS according to IEC 61158/61784 with FMS-5613 software package
- Comprehensive diagnostics possibilities for installation, commissioning and operation of the module
- High performance over direct dual-port RAM access
- Event and filter mechanisms to reduce the loading on the host CPU
- Multiprotocol operation and parallel operation of up to four CPs
- Implementation of Motion Control applications is possible because a constant bus cycle time is supported
- The appropriate OPC servers and configuration tools are included in the scope of supply of the respective communications software.

Benefits

get Designed for Industry

- Fast access to process data by means of direct access to the dual port RAM of the hardware
- High computing performance in the PG/PC; reduces workload of host CPU by preprocessing the communication on the hardware
- Use of different operating system environments; driver as source code for porting to different operating system environments
- Reduced number of slots; through parallel operation as DP master and DP slave
- Can also be used in typical motion control applications
- Real-time capable data exchange in constant bus cycle time mode

Application

The CP 5614 A2 supports the connection of a SIMATIC PG/PC and PCs with a PCI slot to PROFIBUS. It can be either a DP-Master or a DP-Slave.

Two different PROFIBUS networks can then be connected in a hierarchic structure on a PC with a PROFIBUS card and data can be transferred between the two.

The CP 5614 A2 provides high-performance support for control tasks on the PC (PC based Control, Numeric Control, Robot Control).

Design

- Short PCI card
- Operation possible in 3.3 V and 5 V PCI slots (universal keyed)
- 33 MHz or 66 MHz PCI clock
- Operation possible as 32-bit card in a 64-bit PCI X-slot
- 2 x 9-pin sub-D socket for connection to PROFIBUS
- Diagnostics LEDs
- Parallel operation of up to four CPs [1]

The module is installed by means of PCI standard mechanisms (Plug&Play).

If the CP 5614 A2 is used as DP master, DP slave, or in a PG/OP on a PROFIBUS DP, the connection is made:

- **to the electrical PROFIBUS** via
  - Bus connector and PROFIBUS bus cable or
  - bus terminal (e.g. bus terminal 12M) and PROFIBUS bus cable
- **to the optical PROFIBUS with OLM** via
  - bus cable with two bus connectors or
  - PROFIBUS plug-in cable 830-1T
- **to the optical PROFIBUS with OBT and integrated interface** via
  - bus cable with two bus connectors or
  - PROFIBUS plug-in cable 830-1T

[1] FMS-5613 supports up to two CP 5603/CP 5613 A2/5614 A2/CP 5623/CP 5624 processors.

3

■ Function

PROFIBUS DP

Access to process data

The CP 5614 A2 is operated as a PROFIBUS DP master and DP slave module that stores the process image (input/output and diagnostics data) in the dual-port RAM. High-performance data transfer to and from the PROFIBUS slaves is performed autonomously by the hardware of the CP 5614 A2. The user accesses the dual-port RAM directly.

The process data of the slaves is always consistent, i.e. the user receives the data of a slave from one and the same DP cycle.

Parallel operation of the HARDNET-PB DP software (DP master) and DP-Base software (DP master, DP slave) is not possible.

Configuration example CP 5613 A2 as DP master and DP slave

Event filter mechanism

The user receives up-to-date data over two access mechanisms:

- Cyclic polling of the DP slaves (high loading for host CPU)
- Notification through a new type of event/filter mode on changing the input data of a slave (minimal loading for host CPU)

Both alternatives can be combined. This allows users to optimize use of the PC for their applications.

The event/filter mechanism can be used additionally for

- Notification by means of an interrupt of the diagnostic alarms from slaves
- During operation with constant bus cycle time, signaling by means of interrupt:
  - Start DP cycle
  - End cyclic data communication with DP slaves

FastLogic

FastLogic means that the CP 5614 A2 can react autonomously to 4 plant statuses. This results in a short response time and independence from the host application, e.g. fast shutdown of devices.

DP programming interface

The DP master programming interfaces of the CP 5613 A2 and CP 5614 A2 are identical.

The DP programming interface of the CP 5614 A2 features the following functions:

- DP slave
- DP master Class 1 including acyclic DP expansions
- DP master Class 2 including acyclic DP expansions

■ **Function** (continued)

The process data is accessed directly through the dual-port RAM. The DP RAM interface not only offers fast access as DP master/slave but also a basis for porting to other operating system environments (e.g. VXWorks, QNX, RMOS, RTX).

Administrative function calls (initialization and management services as well as diagnostic functions) are provided through a DP master and DP slave library (DP_BASE.DLL and DPS_BASE.DLL).

A transfer mechanism (PC application) can be activated in the software as a linking component for data transfer between the master and slave interface.

Defined I/O data can be transferred in this manner between the master interface and the slave interface.

The two connected PROFIBUS networks can be operated with different PROFIBUS bus parameters because they are independent of each other.

HARDNET-PB DP Development Kit

The HARDNET-PB DP Development Kit provides access to the functions DP master Class 1 and DP slave (incl. acyclic DP expansions)

The HARDNET-PB DP Development Kit software is used to integrate the CP 5613 A2 and CP 5614 A2 communications processors into any operating system environment. The kit contains the necessary source code, including the descriptions in PDF format, and can be downloaded free of charge from the Internet.

Access to process data with HARDNET-PB DP

DP Master Class 1

The CP 5614 A2 operates as a DP master Class 1 according to IEC 61158/61784 and processes the data transfer with the distributed stations (DP slaves) completely autonomously. The central controller exchanges information with the DP slaves (e.g. ET 200S) in a specified, constantly repeating message cycle. The DP programming interface (DPLib.DLL) provides the PC programmer with function calls for data transfer. The DP interface also provides the SYNC and FREEZE functions as well as activation and deactivation of slaves.

The DP function expansions for masters Class 1 make it possible to perform acyclic read and write functions (DS_READ, DS_WRITE) as well as acknowledgement of alarms (ALARM_ACK) at the same time as processing cyclic data communication. Data that are to be transferred in acyclic mode (e.g. parameterization data) are only rarely changed in comparison to the cyclic measured values, and are transferred at lower priority in parallel with the cyclic high-speed user data transfer. Alarm acknowledgement by the master ensures reliable transfer of the alarms from DP slaves (DS_READ, DS_WRITE).

Parallel operation of the DP-Base and HARDNET-PB DP software is not possible.

DP Master Class 2

Apart from the DP master Class 1 services, the CP 5614 A2 also offers DP master Class 2 services according to IEC 61158/61784 in conjunction with the DP programming interface. Devices of this type (programming, configuration or operating devices) are used during commissioning, for configuring the DP system, or for operating the system during normal operation (diagnostics). The DP programming interface provides the following services:

- Master diagnostics
- Slave diagnostics
- Reading the inputs/outputs of a slave
- Reading the configuration data
- Changing slave addresses.

The extended DP functions comprise acyclic access to the parameters and measured values of a slave (e.g. field devices of process automation and intelligent HMI devices). This type of slave must be supplied with extensive parameter data during start-up and during normal operation. (DS_READ, DS_WRITE).

Software for PG/OP communication

This software supports programming of the SIMATIC S5/S7 controllers (with the exception of SIMATIC S5-95U) over PROFIBUS in combination with STEP 5/STEP 7. PG/OP communication for the CP 5614 A2 is already available after the CP 5614 A2 (DP-Base) has been installed. No additional software packages are required.

Open communication (SEND/RECEIVE) based on the FDL interface

SEND/RECEIVE (FDL interface) is already available following installation of the CP 5614 A2 (DP-Base) and provides services for data transfer, diagnostics and management. No additional software packages are required.

Software for S7 communication (HARDNET-PB S7)

SIMATIC S7 system components communicate with each other using S7 communication functions. The S7 programming interface provides programming device/PC user programs with access to SIMATIC S7 system components. This provides easy, flexible access to the data of the SIMATIC S7 controller.

The following services are available with S7 communication:

Administrative services
- Connection management
- Mini database
- Trace

Data transfer services
- Read/write variables
- BSEND/BRECEIVE (up to 64 KB per task)

■ Function (continued)

Software for PROFIBUS FMS (FMS-5613)

With the FMS programming interface, PGs/PCs can exchange different manufacturer data with FMS-capable controllers (e.g. S5 and S7) and field devices. Open communication is assured by using the FMS interface.

The FMS interface offers the following services:

- Administrative services
- CRL management services
- FMS connection management services
- Object directory management services for clients and server
- Variable services for clients and servers (Read, Write, Information Report)
- Server functionality
- VFD services (Virtual Field Device) for clients and servers
- Bus access information services (Live list)
- Trace and mini database

User interfaces

OPC interface

The OPC server included in the respective software package can be used as the standard programming interface for the PROFIBUS DP (DP master and DP slave), open communication, S7 communication and PROFIBUS FMS protocols for linking automation technology applications to OPC-capable Windows applications (Office, HMI systems, etc.).

Programming interface through C library

The programming interfaces for existing applications are implemented as Dynamic Link Libraries (DLL). You can find the released compilers in the Read file of the SIMATIC NET CD products at www.siemens.com/automation/csi/net.

For Borland programming interfaces (e.g. DELPHI), partner solutions from SoftwareOption are offered.

For solutions for other operating systems, see HARDNET-PB DP Development Kit.

Configuration

- S7 communication protocol, open communication protocol, DP protocol (DP-V0/DP-V1/DP-V2) and FMS protocol are configured in STEP 7 or NCM PC V5.1+SP2 and higher.
- The configuration tool NCM PC is included in the PROFIBUS software packages.

Diagnostics

Comprehensive diagnostic tools are available (for installation, start-up and operation) for the module itself and for the PROFIBUS DP network. These tools can be used for quick and easy start-up of a PROFIBUS DP network with a CP 5614 A2.

Preset stripping tool for fast stripping of PROFIBUS FastConnect bus cables	

■ **More information**

You can find the HARDNET-PB DP Development Kit on the Internet.

www.siemens.com/simatic-net/dk5613

■ Overview

DP-M	DP-S	FMS	OPC	PG/OP	S7/S5
●	●	●	●	●	●

- PCI Express card (PCIe x1) with own microprocessor for connecting PCs and SIMATIC PG/PC to PROFIBUS at up to 12 Mbit/s
- Communication services:
  - PROFIBUS DP master Class 1 and 2 or DP slave according to IEC 61158/61784 on a PCI card
  - PG/OP communication with STEP 5 and STEP 7
  - S7 communication with HARDNET-PB S7 software package
  - Open communication (SEND/RECEIVE) based on the FDL interface
  - PROFIBUS FMS according to IEC 61158/61784 with FMS-5613 software package
- Extensive diagnostics options for installation, commissioning and operation of the module
- Event and filter mechanism for reducing the load on the host CPU
- Multiprotocol operation and parallel operation of up to four CPs
- The appropriate OPC servers and configuration tools are included in the scope of supply of the respective communication software

■ Benefits

g **e** **t** **get** Designed for Industry

- Fast access to process data by means of direct access to the dual port RAM of the hardware
- High computing performance in the PG/PC; reduces workload of host CPU by preprocessing the communication on the hardware
- Use of different operating system environments; driver as source code for porting to different operating system environments
- Preventive maintenance measures; deriving of measures by evaluating system runtime and ambient temperature
- Use also in motion control applications; real-time capable data exchange through constant bus cycle time

■ Application

The CP 5623 supports the connection of SIMATIC PG/PC and PCs with PCI Express slot to PROFIBUS.

The CP 5623 provides high-performance support for control tasks on the PC (PC based Control, Numeric Control, Robot Control).

■ Design

- Short PCI Express card
- Can also be operated in PCI Express x4, x8 or x16 slots
- 9-pin sub-D socket for connection to PROFIBUS
- Diagnostic LEDs
- Parallel operation of up to four CPs[1]

The module is installed by means of PCI standard mechanisms (Plug&Play).

If the CP 5623 is used as DP master or in a PG/OP on a PROFIBUS DP, the connection is made:

- **to the electrical PROFIBUS** via
  - bus connector and PROFIBUS bus cable or
  - bus terminal (e.g. bus terminal 12M) and PROFIBUS bus cable
- **to the optical PROFIBUS with OLM** via
  - bus cable with two bus connectors or
  - PROFIBUS plug-in cable 830-1T
- **to the optical PROFIBUS with OBT and integrated interface** via
  - bus cable with two bus connectors or
  - PROFIBUS plug-in cable 830-1T

[1] FMS-5613 supports up to two CP 5603/CP 5613 A2/5614 A2/ CP 5623/CP 5624 processors.

PROFIBUS
Communication for PC-based systems

CP 5623

Function

PROFIBUS DP

Access to process data with DP-Base

The CP 5623 is operated as PROFIBUS DP master module that keeps the process image (input/output and diagnostics data) in the dual port RAM (memory area on the CP). The hardware of the CP 5623 independently executes the high-performance exchange of data with the PROFIBUS slaves. The user accesses the dual-port RAM directly.

The process data of the slaves is always consistent, i.e. the user receives the data of a slave from one and the same DP cycle.

Parallel operation of the HARDNET-PB DP and DP-Base software is not possible.

Example configuration of PROFIBUS DP for SIMATIC S5/S7 and PG/PC

Event filter mechanism

The user receives up-to-date data over two access mechanisms:

- Cyclic polling of the DP slaves (higher loading for host CPU)
- Notification by means of event/filter mode when changing the input data of a slave (minimal loading for host CPU)

Both alternatives can be combined. This allows users to optimize use of the PC for their applications.

The event/filter mechanism can be used additionally for

- Notification by means of an interrupt of the diagnostic messages from slaves
- During operation with constant bus cycle time, signaling by means of interrupt:
  - Start DP cycle
  - End of cyclic data exchange with DP slaves

FastLogic

FastLogic means that the CP 5623 can react autonomously to as many as four plant statuses. This results in a short response time and independence from the host application, e.g. fast shutdown of devices.

DP programming interface

The DP programming interface (DP-Base) of the CP 5623 has the following functionality:

- DP master class 1 including acyclic DP expansions
- DP master class 2 including acyclic DP expansions
- DP slave

The process data is accessed directly through the dual-port RAM. The DP RAM interface not only offers fast access as DP master/slave but also a basis for porting to other operating system environments (e.g. VXWorks, QNX, RMOS, RTX).

Administrative function calls (initialization and management services, as well as diagnostic functions) are provided through a library (DP_BASE.DLL or DPS_BASE.DLL).

HARDNET-PB DP Development Kit

The HARDNET-PB DP Development Kit provides access to the functions DP master Class 1 including acyclic DP expansions

The HARDNET-PB DP Development Kit software enables the CP 5623 communications processor to be integrated into any operating system environments. The kit contains the necessary source code, including the descriptions in PDF format, and can be downloaded free of charge from the Internet.

■ **Function** (continued)

Access to process data with HARDNET-PB DP

DP Master Class 1

The CP 5623 operates as a DP master Class 1 according to IEC 61158/61784 and processes data communication with the distributed stations (DP slaves) completely autonomously. The central controller exchanges information with the DP slaves (e.g. ET 200S) in a specified, constantly repeating message cycle. The DP programming interface (DPLib.DLL) provides the PC programmer with function calls for data transfer. The DP interface also provides the SYNC and FREEZE functions as well as activation and deactivation of slaves.

The DP function expansions for masters Class 1 make it possible to perform acyclic read and write functions (DS_READ, DS_WRITE) as well as acknowledgement of alarms (ALARM_ACK) at the same time as processing cyclic data communication. Data that are to be transferred in acyclic mode (e.g. parameterization data) are only rarely changed in comparison to the cyclic measured values, and are transferred at lower priority in parallel with the cyclic high-speed user data transfer. Alarm acknowledgement by the master ensures reliable transfer of the alarms from DP slaves.

Parallel operation of the DP-Base and HARDNET-PB DP software is not possible.

DP Master Class 2

Apart from the DP master Class 1 services, the CP 5623 also offers DP master class 2 services to IEC 61158/61784 in conjunction with the DP programming interface. Devices of this type (programming, configuration or operating devices) are used during start-up, for configuring the DP system or for operating the system during normal operation (diagnostics). The DP programming interface provides the following services:

- Master diagnostics
- Slave diagnostics
- Reading the inputs/outputs of a slave
- Reading configuration data
- Changing slave addresses.

The extended DP functions comprise acyclic access to the parameters and measured values of a slave (e.g. field devices of process automation and intelligent HMI devices). This type of slave must be supplied with extensive parameter data during start-up and during normal operation (DS_READ, DS_WRITE).

Software for PG/OP communication

This software supports programming of the SIMATIC S5/S7 controllers (with the exception of SIMATIC S5-95U) over PROFIBUS in combination with STEP 5/STEP 7. The PG/OP communication for the CP 5623 is already available following installation of the CP 5623 (DP-Base). No additional software packages are required.

Open communication
(SEND/RECEIVE on the basis of the FDL interface)

SEND/RECEIVE (FDL interface) is already available following installation of the CP 5623 (DP-Base) and provides services for data transfer, diagnostics and management. No additional software packages are required.

Software for S7 communication (HARDNET-PB S7)

SIMATIC S7 system components communicate with each other using S7 communication functions. The S7 programming interface provides programming device/PC user programs with access to SIMATIC S7 system components. This makes for easy and flexible access to SIMATIC S7 data.

The following services are available with S7 communication:

Administrative services

- Connection management
- Mini database
- Trace

Data transfer services

- Read/write variables
- BSEND/BRECEIVE (up to 64 KB per task)

Software for PROFIBUS FMS (FMS-5613)

With the FMS programming interface, PGs/PCs can exchange different manufacturer data with FMS-capable controllers (e.g. S5 and S7) and field devices. Open communication is assured by using the FMS interface.

The FMS interface offers the following services:

- Administrative services
- CRL management services
- FMS connection management services
- Object directory management services for clients and server
- Variable services for clients and servers (Read, Write, Information Report)
- Server functionality
- VFD services (Virtual Field Device) for clients and servers
- Bus access information services (live list)
- Trace and mini database

User interfaces

OPC interface

The OPC server included in the respective software package can be used as the standard programming interface for the PROFIBUS DP, open communication, S7 communication and PROFIBUS FMS in order to connect automation technology applications to OPC-compatible Windows applications (Office, HMI systems, etc.)

Programming interface via C-library

The programming interfaces for existing applications are implemented as Dynamic Link Libraries (DLL). The released compilers can be found in the readme file of the SIMATIC NET CD products at www.siemens.com/automation/csi/net.

For Borland programming interfaces (e.g. DELPHI), partner solutions from SoftwareOption are offered.

For solutions for other operating systems, see HARDNET-PB DP Development Kit.

Configuration

- The S7 communication protocol, open communication protocol, DP protocol (DP-V0/DP-V1/DP-V2), and FMS protocol are configured in STEP 7 or NCM PC V5.1 +SP2.
- The NCM PC configuration tool is included in the scope of delivery of the PROFIBUS software packages.

Diagnostics

Comprehensive diagnostic tools are available (for installation, start-up and operation) for the module itself and for the PROFIBUS DP network. These tools can be used for quick and easy start-up of a PROFIBUS network with a CP 5623.

- Saving of slots through parallel operation as DP master and DP slave
- Preventive maintenance measures; deriving of measures by evaluating system runtime and ambient temperature
- Use also in motion control applications; real-time capable data exchange through constant bus cycle time

Application

The CP 5624 supports the connection of SIMATIC PG/PC and PCs with PCI Express slot to PROFIBUS. It can be both DP master and DP slave.

This enables two different PROFIBUS networks to be connected in a hierarchical structure to a PC and to exchange data using one PROFIBUS card.

The CP 5624 provides high-performance support for control tasks on the PC (PC based Control, Numeric Control, Robot Control).

Design

- Short PCI Express card
- Can also be operated in PCI Express x4, x8 or x16 slots
- 2 x 9-pin sub-D socket for connection to PROFIBUS
- Diagnostic LEDs
- Parallel operation of as many as four CPs [1]

The module is installed by means of PCI standard mechanisms (Plug&Play).

If the CP 5624 is used as DP master, DP slave, or in a PG/OP on a PROFIBUS DP, the connection is made:

- **to the electrical PROFIBUS** via
  - bus connector and PROFIBUS bus cable or
  - bus terminal (e.g. bus terminal 12M) and PROFIBUS bus cable
- **to the optical PROFIBUS with OLM** via
  - bus cable with two bus connectors or
  - PROFIBUS plug-in cable 830-1T
- **to the optical PROFIBUS with OBT and integrated interface** via
  - bus cable with two bus connectors or
  - PROFIBUS plug-in cable 830-1T

[1] FMS-5613 supports up to two CP 5603/CP 5613 A2/5614 A2/ CP 5623/CP 5624 processors.

PROFIBUS
Communication for PC-based systems

CP 5624

Function

PROFIBUS DP

Access to process data

The CP 5624 is operated as PROFIBUS DP master and DP slave module, which keeps the process image (input/output and diagnostic data) in the dual port RAM. The hardware of the CP 5624 independently executes the high-performance exchange of data with the PROFIBUS slaves. The user accesses the dual-port RAM directly.

The process data of the slaves are always consistent, i.e. the user receives the data of a slave from one and the same DP cycle.

Parallel operation of the HARDNET-PB DP software (DP master) and DP-Base software (DP master, DP slave) is not possible.

Example configuration of CP 5624 as DP master and DP slave

Event filter mechanism

The user receives up-to-date data over two access mechanisms:

- Cyclic polling of the DP slaves (high loading for host CPU)
- Notification through a new type of event/filter mode on changing the input data of a slave (minimal loading for host CPU)

Both alternatives can be combined. This allows users to optimize use of the PC for their applications.

The event/filter mechanism can be used additionally for

- Notification by means of an interrupt of the diagnostic messages from slaves
- During operation with constant bus cycle time, signaling by means of interrupt:
  - Start DP cycle
  - End cyclic data communication with DP slaves

FastLogic

FastLogic means that the CP 5624 can react autonomously to as many as four plant statuses. This results in a short response time and independence from the host application, e.g. fast shutdown of devices.

DP programming interface

The DP programming interface of the CP 5624 has the following functionality:

- DP slave
- DP master Class 1 including acyclic DP expansions
- DP master Class 2 including acyclic DP expansions

The process data is accessed directly through the dual-port RAM. The DP RAM interface not only offers fast access as DP master/slave but also a basis for porting to other operating system environments (e.g. VXWorks, QNX, RMOS, RTX).

■ Function (continued)

Administrative function calls (initialization and management services as well as diagnostic functions) are provided through a DP master and DP slave library (DP_BASE.DLL and DPS_BASE.DLL).

A transfer mechanism (PC application) can be activated in the software as a linking component for data transfer between the master and slave interface.

Defined I/O data can be transferred in this manner between the master interface and the slave interface.

The two connected PROFIBUS networks can be operated with different PROFIBUS bus parameters because they are independent of each other.

HARDNET-PB DP Development Kit

The HARDNET-PB DP Development Kit provides access to the functions DP master Class 1 and DP slave (incl. acyclic DP expansions)

The HARDNET-PB DP Development Kit software enables the CP 5624 communications processor to be integrated into any operating system environments. The kit contains the necessary source code, including the descriptions in PDF format, and can be downloaded free of charge via the Internet.

Access to process data with HARDNET-PB DP

DP Master Class 1

The CP 5624 operates as a DP master Class 1 according to IEC 61158/61784 and processes data communication with the distributed stations (DP slaves) completely autonomously. The central controller exchanges information with the DP slaves (e.g. ET 200S) in a specified, constantly repeating message cycle. The DP programming interface (DPLib.DLL) provides the PC programmer with function calls for data transfer. The DP interface also provides the SYNC and FREEZE functions as well as activation and deactivation of slaves.

The DP function expansions for masters Class 1 make it possible to perform acyclic read and write functions (DS_READ, DS_WRITE) as well as acknowledgement of alarms (ALARM_ACK) at the same time as processing cyclic data communication. Data that are to be transferred in acyclic mode (e.g. parameterization data) are only rarely changed in comparison to the cyclic measured values, and are transferred at lower priority in parallel with the cyclic high-speed user data transfer. Alarm acknowledgement by the master ensures reliable transfer of the alarms from DP slaves (DS_READ, DS_WRITE).

Parallel operation of the DP-Base and HARDNET-PB DP software is not possible.

DP Master Class 2

Apart from the DP master Class 1 services, the CP 5624 also offers DP master class 2 services to IEC 61158/61784 in conjunction with the DP programming interface. Devices of this type (programming, configuration or operating devices) are used during start-up, for configuring the DP system, or for operating the system during normal operation (diagnostics). The DP programming interface provides the following services:

- Master diagnostics
- Slave diagnostics
- Reading the inputs/outputs of a slave
- Reading configuration data
- Changing slave addresses

The extended DP functions comprise acyclic access to the parameters and measured values of a slave (e.g. field devices of process automation and intelligent HMI devices). This type of slave must be supplied with extensive parameter data during start-up and during normal operation. (DS_READ, DS_WRITE).

Software for PG/OP communication

This software supports programming of the SIMATIC S5/S7 controllers (with the exception of SIMATIC S5-95U) over PROFIBUS in combination with STEP 5/STEP 7. The PG/OP communication for the CP 5624 is already available following installation of the CP 5624 (DP-Base). No additional software packages are required.

Open communication
(SEND/RECEIVE on the basis of the FDL interface)

SEND/RECEIVE (FDL interface) is already available following installation of the CP 5624 (DP-Base) and provides services for data transfer, diagnostics and management. No additional software packages are required.

Software for S7 communication (HARDNET-PB S7)

SIMATIC S7 system components communicate with each other using S7 communication functions. The S7 programming interface provides programming device/PC user programs with access to SIMATIC S7 system components. This makes for easy and flexible access to SIMATIC S7 data.

The following services are available with S7 communication:

Administrative services

- Connection management
- Mini database
- Trace

Data transfer services

- Read/write variables
- BSEND/BRECEIVE (up to 64 KB per task)

Software for PROFIBUS FMS (FMS-5613)

With the FMS programming interface, PGs/PCs can exchange different manufacturer data with FMS-capable controllers (e.g. S5 and S7) and field devices. Open communication is assured by using the FMS interface.

The FMS interface offers the following services:

- Administrative services
- CRL management services
- FMS connection management services
- Object directory management services for clients and server
- Variable services for clients and servers (Read, Write, Information Report)
- Server functionality
- VFD services (Virtual Field Device) for clients and servers
- Bus access information services (live list)
- Trace and mini database

3

PROFIBUS
Communication for PC-based systems

CP 5624

■ **Function** (continued)

User interfaces

OPC interface

The OPC server included in the respective software package can be used as the standard programming interface for the PROFIBUS DP (DP master and DP slave), open communication, S7 communication and PROFIBUS FMS in order to connect automation technology applications to OPC-compatible Windows applications (Office, HMI systems, etc.).

Programming interface via C-library

The programming interfaces for existing applications are implemented as Dynamic Link Libraries (DLL). The released compilers can be found in the readme file of the SIMATIC NET CD products at www.siemens.com/automation/csi/net.

For Borland programming interfaces (e.g. DELPHI), partner solutions from SoftwareOption are offered.

For solutions for other operating systems, see HARDNET-PB DP Development Kit.

Configuration

- The S7 communication protocol, open communication protocol, DP protocol (DP-V0/DP-V1/DP-V2) and FMS protocol are configured in STEP 7 or NCM PC version V5.1 +SP2 or higher.
- The NCM PC configuration tool is included in the scope of delivery of the PROFIBUS software packages.

Diagnostics

Comprehensive diagnostic tools are available (for installation, start-up and operation) for the module itself and for the PROFIBUS DP network. These tools can be used for quick and easy start-up of a PROFIBUS DP network with a CP 5624.

Configuration example for CP 5624

PROFIBUS
Communication for PC-based systems

CP 5611 A2

Overview

DP-M	DP-S	FMS	OPC	PG/OP	S7/S5
●	●		●	●	●

- PCI card (universal-keyed 5 V/3.3 V) for connecting PCs and SIMATIC PG/PC to PROFIBUS at up to 12 Mbit/s and to the MPI interface of SIMATIC S7
- Communication services:
  - PROFIBUS DP Master Class 1 incl. acyclic DP expansions with SOFTNET-PB DP software package
  - PROFIBUS DP Master Class 2 incl. acyclic DP expansions with SOFTNET-PB DP software package
  - PROFIBUS DP slave with SOFTNET-PB DP Slave software package
  - PG/OP communication with STEP 5 or STEP 7
  - S7 communication with SOFTNET-PB S7 software package
  - Open communication (SEND/RECEIVE on basis of the FDL interface) with SOFTNET-PB DP or SOFTNET-PB S7 software package
- Can be used with:
  - STEP 7, STEP 7-Micro/Win, ProTool, ProTool/Pro, SIMATIC PDM (for PG/OP communication)
  - COM PROFIBUS
  - SOFTNET-PB S7 (for S7 communication)
  - SOFTNET-PB DP, SOFTNET-PB DP slave (for DP)
- The appropriate OPC servers and configuration tools are included in the scope of supply of the respective communications software.

Benefits

get — Designed for Industry

- Interface for portable PCs (e.g. for diagnostics and commissioning)
- Easy installation and startup
- Optimally matched to SOFTNET
- OPC as standard interface
- Uniform procedure and configuration functions for NCM PC and STEP 7
- Flexible use possible in PG/PC through PCI 3.3/5 V, 33/66 MHz and compatibility with 64-bit PCI X-slot

Application

The CP 5611 A2 is used to connect programming devices and PCs to PROFIBUS and to the multipoint MPI interface of SIMATIC S7:
- for programming devices and PCs with a PCI slot

Design

- Short PCI card
- Operation possible in 3.3 V and 5 V PCI slots (universal keyed)
- 33 MHz or 66 MHz PCI clock
- Operation possible as 32-bit card in a 64-bit PCI X-slot
- 9-pin sub-D socket for connection to PROFIBUS

Function

Various software packages can be used to operate the CP 5611 A2, which allows the user to execute programming device functions and PC functions over PROFIBUS and the multipoint interface MPI.

Only one CP can be used per PG or PC. Similarly only one protocol (PROFIBUS DP, S7 communication or FDL) can be used per CP.

The following software packages support the CP 5611 A2:
- STEP 7 V3.2 and higher; drivers for the CP 5611 A2 are included in the scope of supply of STEP 7.
- SOFTNET-S7 V3.2 and higher; this package allows the S7 programming interface to be used.
- SOFTNET-DP V3.2 and higher; the CP 5611 A2 can be used as a PROFIBUS DP master Class 1 or 2.
- SOFTNET DP slave V3.2 and higher; for using the CP 5611 A2 as a PROFIBUS DP slave.
- COM PROFIBUS V3.3 and higher; the CP 5611 A2 can be used in combination with this package for start-up or diagnostics (DP online functions) for PROFIBUS DP systems.
- STEP 7-Micro/WIN V2.1 and higher; hardware basis for the programming software of the SIMATIC S7-200 programmable controller
- ProTool, ProTool/Pro; the CP 5611 A2 can be used as a hardware basis for the configuration tool for all SIMATIC Operator Panels, Touch Panels and Text Displays.
- NCM PC; drivers for the CP 5611 A2 are included in the scope of supply
- WinCC/WinCC flexible; drivers for the CP 5611 A2 are included in the scope of supply

PROFIBUS
Communication for PC-based systems

CP 5621

■ Overview

DP-M	DP-S	FMS	OPC	PG/OP	S7/S5
●	●		●	●	●

- PCI Express card (PCIe x1) for connection of PCs and SIMATIC PG/PC to PROFIBUS at up to 12 Mbit/s and to the MPI of the SIMATIC S7
- Communication services:
  - PROFIBUS DP Master Class 1 incl. acyclic DP expansions with SOFTNET-PB DP software package
  - PROFIBUS DP Master Class 2 incl. acyclic DP expansions with SOFTNET-PB DP software package
  - PROFIBUS DP slave with SOFTNET-PB DP Slave software package
  - PG/OP communication with STEP 5 or STEP 7
  - S7 communication with SOFTNET-PB S7 software package
  - Open communication (SEND/RECEIVE on basis of the FDL interface) with SOFTNET-PB DP or SOFTNET-PB S7 software package
- Can be used with:
  - STEP 7, STEP 7-Micro/Win, ProTool, ProTool/Pro, SIMATIC PDM (for PG/OP communication)
  - COM PROFIBUS
  - SOFTNET-PB S7 (for S7 communication)
  - SOFTNET-PB DP, SOFTNET-PB DP slave (for DP)
- The appropriate OPC server and configuration tools are included in the scope of supply of the respective communication software.

■ Benefits

get Designed for Industry

- Connection for portable PCs (e.g. for diagnostics and commissioning)
- Simple installation and commissioning
- Optimally coordinated with SOFTNET
- OPC as standard interface
- Standardized procedure and configuration functionality for NCM PC and STEP 7
- Can be used flexibly as PCIe x1 card in PC/IPC with PCI Express x1, x4, x8 or x16 slots

■ Application

The CP 5621 permits the connection of programming devices (PGs) and PCs to PROFIBUS and to the multipoint interface (MPI) of the SIMATIC S7:
- for PGs/PCs with PCI Express slot

■ Design

- Short PCI card
- 9-pin sub-D socket for connection to PROFIBUS
- Operation in the PCI Express x1, x4, x8 or x16 slots is possible

■ Function

The CP 5621 is operated under various software packages and offers the user the opportunity of performing functions of the programming devices and PCs by means of PROFIBUS and the multipoint interface (MPI).

Only one CP can be used per PG or PC. Likewise, only one protocol (PROFIBUS DP, S7-communication or FDL) can be used per CP.

The following software packs support the CP 5621:
- STEP 7 V5.4 SP 4 or higher;
  Drivers for the CP 5621 are included in the scope of delivery of STEP 7.
- SOFTNET-S7 V7.0 or higher;
  This package enables the S7 programming interface to be used.
- SOFTNET-DP V7.0 or higher;
  This enables the CP 5621 to be used as PROFIBUS DP Master Class 1 or Class 2.
- SOFTNET-DP Slave V7.0 or higher;
  For use of the CP 5621 as PROFIBUS DP slave
- STEP 7-Micro/WIN;
  Hardware basis for the programming software of the SIMATIC S7-200 automation system
- ProTool, ProTool/Pro;
  The CP 5621 can be used as the hardware basis for the configuration tool for all SIMATIC Operator Panels, Touch Panels and Text Displays.
- NCM PC;
  Drivers for the CP 5621 are included in the scope of supply (beginning with SIMATIC NET CD, 2007 Edition).
- WinCC/WinCC Flexible;
  Drivers for the CP 5621 are included in the scope of supply (beginning with SIMATIC NET CD Edition 2007).

PROFIBUS
Communication for PC-based systems

CP 5711

Overview

DP-M	DP-S	FMS	OPC	PG/OP	S7/S5
●	●		●	●	●

- USB adapter for the connection of PCs and SIMATIC PG/PC to PROFIBUS DP or MPI via USB 2.0
- Operation in extended temperature range of -20 °C to +60 °C
- Active PROFIBUS termination to supply the PROFIBUS network as end station of a segment
- Robust USB connection due to mechanical locking of the USB connector to the CP 5711 enclosure
- Communication services:
  - PROFIBUS DP master Class 1 and 2 according to IEC 61158/61784 with SOFTNET-PB DP software package
  - PROFIBUS DP slave with SOFTNET-PB DP Slave software package
  - PG/OP communication with STEP 5 or STEP 7 software package
  - S7 communication with SOFTNET-PB S7 software package
  - Open communication (SEND/RECEIVE on basis of the FDL interface) with SOFTNET-PB DP or SOFTNET-PB S7 software package
- PROFIBUS connection with up to 12 Mbit/s
- Can be used with:
  - STEP 7, STEP 7 Micro/WIN, WinCC/WinCC flexible, NCM PC, SIMATIC PDM (for PG/OP communication)
  - SOFTNET-PB S7 (for S7 communication)
  - SOFTNET-PB DP, SOFTNET-PB DP slave (for DP)
- The appropriate OPC servers and configuration tools are included in the scope of supply of the respective communication software

Benefits

g e**get** t   Designed for Industry

- Portability and flexibility: Connection for portable PCs, e.g. for diagnostics and commissioning
- Low-cost PROFIBUS controller and device solutions for embedded PCs (without PCI or PC104 bus)
- Fault-free connection to the PROFIBUS diagnosis at all times due to permanent installation on PROFIBUS and connection via USB in the event of maintenance and diagnosis
- Easy installation and commissioning due to plug & play technology

Application

The CP 5711 enables the connection of SIMATIC PG/PC and PCs with USB interface to PROFIBUS and to the multi-point interface (MPI) of SIMATIC S7.

Design

- USB V2.0 connection
- Adapter with 9-pin sub-D socket for connection to PROFIBUS

Function

The CP 5711 is a USB V2.0 adapter that can be used on either a USB V2.0 port (bandwidth 480 Mbit/s) or a USB V1.1 port (1.5 Mbit/s). It can be used with various software packages and offers users the ability to perform functions of the programming devices and PCs/OPs via PROFIBUS and the multi-point interface (MPI).

The CP 5711 is powered directly via the USB interface of the PC system. Regardless of whether the USB cable is plugged in or unplugged, the active power supply of the PROFIBUS network is drawn from the external 24 V DC power supply unit.

Optional for the use of the CP 5711 in control cabinets or in the vicinity of SIMATIC S7 controllers, a mounting adapter (DIN rail) is available to attach the CP to the 35 mm DIN rail.

Only one CP per PG/PC/OP can be operated. Likewise, only one protocol (PROFIBUS DP, S7 communication, or FDL) can be used per CP.

3

Function (continued)

The following software packages support the CP 5711:

- STEP 7 from V5.4 SP5;
  drivers for the CP 5711 are included with STEP 7.
- SOFTNET-S7 from V7.1;
  the S7 programming interface can be used with this package.
- SOFTNET-DP from V7.1;
  with this, the CP 5711 can be used as PROFIBUS DP master Class 1 or 2.
- SOFTNET-DP slave from V7.1;
  for operating the CP 5711 as PROFIBUS DP slave
- STEP 7-Micro/WIN;
  drivers for the CP 5711 are included with STEP 7-Micro/WIN.
- WinCC/WinCC flexible;
  the CP 5711 can be used as a hardware basis for the configuration tool for SIMATIC Operator Panels, Touch Panels, and Text Displays.
- NCM PC;
  under Windows XP Professional
- SIMATIC PDM;
  drivers for the CP 5711 are included with SIMATIC PDM.

Diagnostics

Numerous diagnostic tools are available for the CP 5711. For support, the module also includes comprehensive LED diagnostics. Operating and signal states can be recognized quickly via five LEDs.

Configuration

- The S7 communication and open communication protocols can be configured in STEP 7 or NCM PC.

The NCM PC configuration tool is included with the software packages SOFTNET-PB S7 and SOFTNET-PB DP for PROFIBUS.

Overview

PC/IPC with CP 5611 A2/ CP 5621/CP 5512 and SOFTNET for PROFIBUS

■ PROFIBUS

S7-1200 with CM 1243-5

S5-115U to S5-155U with CP 5431 FMS/DP

S7-300 with CP 342-5 or CP 343-5

S7-400 with CP 443-5

G_IK10_XX_50039

DP-M	DP-S	FMS	OPC	PG/OP	S7/S5
●	●		●	●	●

- Software for coupling PCs/programming devices and notebooks to programmable controllers
- Communication services:
  - PROFIBUS DP master Class 1 and 2 with acyclic expansions
  - PROFIBUS DP slave
  - PG/OP communication
  - S7 communication
  - Open communication (SEND/RECEIVE) based on the FDL interface
- The appropriate OPC servers are included in the scope of supply of the respective communication software
- Can be used with:
  - CP 5512 (PC card, CardBus 32-bit)
  - CP 5611 A2 (PCI, 32-bit)
  - CP 5711 (USB V2.0)
  - CP 5621 (PCIe x1)
  - Integral PROFIBUS interfaces of SIMATIC PGs/PCs

Benefits

g e get Designed for Industry

- Maximum transparency due to integrated communication with SIMATIC via PROFIBUS and OPC as the standard interface
- Low-cost connection
  - as PROFIBUS DP master class 1 or master class 2 with SOFTNET-PB DP
  - as PROFIBUS DP slave with SOFTNET-PB DP slave
  - to S7 communication with SOFTNET-PB S7
- Simple and low-cost commissioning thanks to uniform procedure and configuration functionality with NCM PC and STEP 7

Application

With SOFTNET for PROFIBUS, PCs can be connected to programmable controllers, such as SIMATIC S7, over PROFIBUS.

The following user interfaces are available:

- DP protocol
- PG/OP communication for SIMATIC S7
- S7 communication
- Open communication (SEND/RECEIVE) based on the FDL interface

SOFTNET is available for the following interfaces:

- CP 5512 (PC card, CardBus 32-bit)
- CP 5611 A2 (PCI, 32-bit)
- CP 5711 (USB V2.0)
- CP 5621 (PCIe x1)
- Integral PROFIBUS interfaces of SIMATIC PGs/PCs

The operating systems that are supported are listed in the ordering data for the SOFTNET software.

PROFIBUS
Communication for PC-based systems

SOFTNET for PROFIBUS

Function

Software for DP protocol (SOFTNET-PB DP)

DP Master Class 1

SOFTNET-PB DP provides DP Master Class 1 functionality in combination with the CP 5512, CP 5611 A2 or CP 5621. The central controller exchanges information with the DP slaves (e.g. ET 200S) in a specified, constantly repeating message cycle. The DP programming interface (DPLib.DLL) provides the PC programmer with function calls for data transfer. The DP interface also provides the SYNC and FREEZE functions as well as activation and deactivation of slaves.

The DP function expansions for masters of Class 1 make it possible to perform read and write functions (DS_READ, DS_WRITE) as well as acknowledgement of alarms (ALARM_ACK) at the same time as processing cyclic data communication. Data that are to be transferred in acyclic mode (e.g. parameterization data) are only rarely changed in comparison to the cyclic measured values, and are transferred at lower priority in parallel with the cyclic high-speed user data transfer. Alarm acknowledgement by the master ensures reliable transfer of the alarms from DP slaves (DS_READ, DS_WRITE, DS_DATA_TRANSPORT).

DP Master Class 2

In addition to DP master Class 1 services, SOFTNET-PB DP also provides DP Master Class 2 services. Devices of this type are used (programming, configuration or control devices) during start-up, for configuring the DP system or for controlling the plant during normal operation (diagnostics). The DP programming interface provides the following services: Reading master diagnostics, slave diagnostics, inputs/outputs of a slave, config-uration data and modifying slave addresses. These extended DP functions comprise non-isochronous access to the param-eters and measured values of a slave (e.g. field devices of process automation and intelligent HMI devices). This type of slave must be supplied with extensive parameter data during start-up and during normal operation (DS_READ, DS_WRITE, DS_DATA_TRANSPORT).

DP slave (SOFTNET-PB DP slave)

A DP slave is an I/O station that reads in input data and transfers output data to the I/O. The volume of input and output infor-mation is determined by the user application and can be a maximum of 122 bytes each. For the slave interface, a simple example GSD file is provided that can be adapted by the user to the slave application. This GSD file can be configured using any configuration tool which complies with the PROFIBUS DP specification IEC 61158/EN 50170, e.g. STEP 7 or NCM PC.

Software for PG/OP communication

Special programming device packages are not required for the CP 5512, CP 5611 A2, CP 5711 and CP 5621, because the drivers are included in the STEP 7 scope of supply.

Software for S7 communication (SOFTNET-PB S7)

SIMATIC S7 system components communicate with each other using S7 communication functions. The S7 programming interface provides programming device/PC user programs with access to SIMATIC S7 system components. This provides easy, flexible access to the data of the SIMATIC S7 controller.

The following services are available with S7 communication:

Administrative services

- Connection management
- Mini database
- Trace

Data transfer services

- Read/write variables
- BSEND/BRECEIVE (up to 64 KB per task)

Software for open communication (SEND/RECEIVE based on the FDL interface)

This interface based on Layer 2 is used for communication between

- PG/PC and SIMATIC S5
- PG/PC and SIMATIC S7
- PG/PC and PG/PC

used

SEND/RECEIVE offers the following services:

- Management services
- Connection establishment services
- Data transfer services

This interface is included in SOFTNET-PB DP and SOFTNET-PB S7. No configuration is necessary.

User interfaces

OPC interface

The OPC server included in the respective software package can be used as the standard programming interface for the PROFIBUS DP, open communication and S7 communication protocols for linking automation technology applications to OPC-capable Windows applications (Office, HMI systems, etc.).

Mode of operation

With SOFTNET, the complete protocol stack is processed in the PC.

This architecture means that in contrast to the CP 5613 or CP 5614 products, the performance of the SOFTNET packages is dependent on the configuration or loading of the PC used.

Configuration

- The S7 communication protocol, open communication protocol and DP protocol are configured in STEP 7/NCM PC V5.1 + SP2 and higher.
- The configuration tool NCM PC is included in the PROFIBUS software packages.

Technical specifications

Performance data	CP 5512/CP 5611 A2/ CP 5621/CP 5711
Mono protocol mode	
Number of connectable DP slaves	max. 60
Number of FDL tasks waiting	max. 50
Number of PG/OP and S7 connections	max. 8
• DP master	DP-V0, DP-V1 with SOFTNET-PB DP
• DP slave	DP-V0, DP-V1 with SOFTNET-PB DP slave

3

Ordering data	Order No.

SOFTNET-PB S7

Software for S7 communication, incl. FDL protocol with OPC server and NCM-PC, runtime software, software and electronic manual on CD-ROM, license key on USB flash drive, Class A; for CP 5611 A2, CP 5711, CP 5621;

SOFTNET-PB S7 V8.1

For 32/64-bit:
Windows 7 Professional/Ultimate;
for 64-bit:
Windows 2008 Server R2
English/German
• Single license for one installation — **6GK1 704-5CW08-1AA0**

SOFTNET-S7 Edition 2008 (V7.1)

for 32 Bit
Windows XP Professional SP2/3;
Windows 2003 Server R2, SP2;
Windows Vista Business/Ultimate SP1; Windows 2008 Server;
English/German
• Single license for one installation — **6GK1 704-5CW71-3AA0**

Software Update Service — **6GK1 704-5CW00-3AL0**

For 1 year
with automatic extension;
requirement:
current software version

Upgrade
• From Edition 2006 to SOFTNET-S7 Edition 2008 or V8.1 — **6GK1 704-5CW00-3AE0**
• From V6.0, V6.1, V6.2 or V6.3 to SOFTNET-S7 Edition 2008 or V8.1 — **6GK1 704-5CW00-3AE1**

SOFTNET-PB DP

Software for DP protocol (master class 1 and 2), incl. FDL protocol with OPC server and NCM PC, runtime software, software and electronic manual on CD-ROM, license key on USB flash drive; for CP 5611 A2, CP 5711, CP 5621;

SOFTNET-PB DP V8.1

For 32/64-bit:
Windows 7 Professional/Ultimate;
for 64-bit:
Windows 2008 Server R2
English/German
• Single license for one installation — **6GK1 704-5DW08-1AA0**

SOFTNET-DP Edition 2008 (V7.1)

for Windows XP
Professional SP2/3;
Windows 2003 Server R2, SP2;
Windows Vista Business/Ultimate SP1; Windows 2008 Server;
English/German
• Single license for one installation — **6GK1 704-5DW71-3AA0**

Software Update Service — **6GK1 704-5DW00-3AL0**

For 1 year
with automatic extension;
requirement:
current software version

Upgrade
• From Edition 2006 to SOFTNET-DP Edition 2008 or V8.1 — **6GK1 704-5DW00-3AE0**
• From V6.0, V6.1, V6.2 or V6.3 to SOFTNET-DP Edition 2008 or V8.1 — **6GK1 704-5DW00-3AE1**

SOFTNET-PB DP slave

Software for DP slave, with DP OPC server and NCM PC, single license for one installation, runtime software, software and electronic manual on CD-ROM, license key on USB flash drive, Class A; for CP 5611 A2, CP 5711, CP 5621;

SOFTNET-PB DP Slave V8.1

For 32/64-bit:
Windows 7 Professional/Ultimate;
for 64-bit:
Windows 2008 Server R2
English/German
• Single license for one installation — **6GK1 704-5SW08-1AA0**

SOFTNET-DP Slave Edition 2008 (V7.1)

for 32 Bit
Windows XP Professional SP2/3;
Windows 2003 Server R2, SP2;
Windows Vista Business/Ultimate SP1; Windows 2008 Server;
English/German
• Single license for one installation — **6GK1 704-5SW71-3AA0**

Software Update Service — **6GK1 704-5SW00-3AL0**

For 1 year
with automatic extension;
requirement:
current software version

Upgrade
• From Edition 2006 to SOFTNET-DP Slave Edition 2008 or V8.1 — **6GK1 704-5SW00-3AE0**
• From V6.0, V6.1, V6.2 or V6.3 to SOFTNET-DP Slave Edition 2008 or V8.1 — **6GK1 704-5SW00-3AE1**

OPC Server for PROFIBUS

Overview

- Standardized, open multi-vendor interface
- Interfacing of OPC-capable Windows applications to DP, FMS, S7 communication and open communication (SEND/RECEIVE) based on the FDL interface

- OPC Scout with browser functionality as an OPC client and OCX-Data-Control/.NET Data Control for simple OPC client creation
- The relevant OPC servers are supplied with each communication software package

3

System integration with OPC server

Benefits

get   Designed for Industry

- Different networks and protocols can be easily used thanks to the uniform interface
- Reduced training and familiarization costs
- Easy interfacing in the system environment and office applications over C++, Visual Basic and .NET interfaces
- Fast creation of applications
- Easy handling and cost-effective because the corresponding OPC server is included in the scope of supply of the respective communications software

Application

OPC (Openness, Productivity & Collaboration) is implemented as an expansion of the COM (Component Object Model) communications interface and DCOM (Distributed COM) for the user software.

The basic principle of OPC is that OPC client applications communicate with the OPC server over a standardized, open and manufacturer-independent interface.

It is also possible to connect to OPC-capable Windows applications (Microsoft Office or HMI systems) that are already available on the market.

The following communications interfaces are available over OPC for PROFIBUS:

- DP communication for PROFIBUS DP
- DP-V0 Master Class 1 and Master Class 2
  DP-V1 Master Class 1 and Master Class 2
  PROFIdrive V3 interface for profile server
- FMS communication for PROFIBUS FMS
- S7 communication
- Open communication (SEND/RECEIVE) based on the FDL interface

The OPC server offers:

- Data Access interface 2.05
- Alarm&Event interface 1.1
- OPC XML DA interface 1.0
- Integration of automation products of different manufacturers
- The same, easy-to-use user interface for different components
- Can be accessed from every computer in the LAN
- High-performance data access over the Custom Interface (C++, NET)
- Easy to use with the "Automation Interface" (VB, NET) or the supplied OCX Data Control or .NET Data Control
- Grouping of variables (items); this way large quantities of data can be processed in a short time
- Other compilers can be used via the OPC server, however, the compiler must support the COM interface (Microsoft component model)

Function

- Open standardization of the addressing using logical names for objects from an automation component or an automation system
- Supports STEP 7 symbols
- Efficient data transfer from a process component to an application for further processing
- One client application can use several servers simultaneously
- Simultaneous execution of more than one client is possible on one OPC server
- The communication protocols can be operated in parallel
- Interfaces
  - "Custom Interface" for high-performance C++/NET applications
  - "Automation Interface" for easily created Visual Basic applications (or similar)
  - OCX Data Control or .NET Data Control for simple connection to Windows applications that support COM/DCOM
  - XML DA interface;
    Data access to S7 CPUs is therefore possible over the Internet.

Configuration

The communication parameters are configured using only the tools of the configuration software (configuration console, SIMATIC NCM PC or STEP 7 V5.1 + SP2 and higher)

PROFIBUS
Communication for PC-based systems

OPC Server for PROFIBUS

■ **Function** (continued)

Comparison of conventional client/server architecture with an OPC architecture

■ **Technical specifications**

Programming	• Synchronous and asynchronous reading and writing of variables • Monitoring of variables using the OPC server with a signal to the client when a change occurs • Use of quantity operations; so a large amount of data can be processed in a short time.
Interfaces	• Custom Interface (C++, NET); for high OPC performance • Automation Interface (VB, Excel, Access, Delphi, ...) for ease-of-use • Graphics with OCX or .NET Data Control; for configuring instead of programming • OPC XML-Interface for Data Access
Protocols	• S7 communication • Open communication (SEND/RECEIVE) • PROFIBUS DP • PROFIBUS FMS

Product versions	include OPC servers for:
HARDNET-PB DP	PROFIBUS DP, XML-DA
HARDNET-PB S7	S7 communication, XML-DA
FMS-5613	FMS communication, XML-DA
SOFTNET-PB S7	S7 communication, XML-DA
SOFTNET-PB DP	PROFIBUS DP, XML-DA
SOFTNET-PB DP slave	PROFIBUS DP, Slave XML-DA
CP 5603/CP 5613 A2/CP 5623/ CP 5614 A2 and CP 5624 with DP-Base software	Open communication (FDL) PROFIBUS DP Master, Access to DP-slave of the CP 5614 A2/CP 5624, XML-DA

Overview

OPC (**O**penness, **P**roductivity & **C**ollaboration) is a standard-ized, open, and vendor-independent interface that is widely used in automation. OPC UA (**U**nified **A**rchitecture) is the result of consistent further development of this standard, offering additional functions such as security or redundancy.

S7 OPC Redundancy is a software product compliant with the OPC UA standard that enables the redundant configuration of OPC UA servers to SIMATIC S7. The availability of automation data to operator control and monitoring systems is guaranteed thanks to the redundant use of OPC UA servers. This requires neither additional cabling for synchronizing the redundant OPC UA servers, nor additional programming overhead in the PC. The OPC UA servers are synchronized via high-performance Industrial Ethernet network access points at 10/100 and 1000 Mpbs. S7 OPC Redundancy represents an integrated customer solution for all SIMATIC NET S7 SOFTNET and HARDNET software products in the automation world.

Benefits

- Enhanced plant availability thanks to redundant OPC UA servers that guarantee plant access for operator control and monitoring systems
- Secures investments thanks to the use of existing applications (OPC clients) and flexible application options, regardless of the SIMATIC S7 controller used
- Improved utilization of IT resources thanks to even distribution of the OPC clients among the redundant OPC servers
- Easy and low-cost commissioning thanks to uniform procedure and configuration functionality with NCM PC and STEP 7

Application

The redundant OPC UA server software enables redundant configuration of SIMATIC NET OPC UA servers. Failure of one OPC UA server, as a result of power outage or system failure, for example, results in immediate use of the other OPC UA server, and continuation of the existing OPC UA client connection. This ensures increased availability of automation data to operator control and monitoring systems.

Design

Redundant use of OPC servers

A redundant OPC UA server system comprises the following:

Server PC
with

- Operating system for Windows server
- SOFTNET-PB S7 or HARDNET-PB S7 software based on OPC UA server
- S7 OPC Redundancy software

The redundant operation of up to two OPC UA servers is possible.

Client PC (HMI)

- Software for OPC clients that supports OPC UA (incl. reconnect functionalities in accordance with OPC UA specification)

The communication parameters are configured using STEP 7 or SIMATIC NET NCM PC. The NCM PC configuration tool is included in the scope of delivery of the SIMATIC NET PC products.

PROFIBUS
Communication for PC-based systems

S7 OPC Redundancy for PROFIBUS

3

■ Function

S7 OPC Redundancy enables the setup of redundant OPC UA servers, thus ensuring plant access for the operator control and monitoring systems.

This means, for example, that the information synchronization between two SIMATIC NET S7 OPC servers via the S7 OPC Redundancy software package is guaranteed. This is handled transparently for the OPC Client application so that in the event of a fault, the redundant OPC server takes over the tasks from the failed OPC server system.

Data exchange between the OPC clients and the OPC servers takes place via the standardized OPC UA communication. Communication with the SIMATIC S7 controller takes place using the S7 protocol. This is ensured by the software products SIMATIC NET SOFTNET or HARDNET-S7 for PROFIBUS that are necessary as the basis for SIMATIC NET IE S7 OPC Redundancy.

The S7 OPC Redundancy software package supports:

- High availability;
  Failure of one OPC UA server results in immediate use of the other OPC UA server, and continuation of the existing OPC UA client connection. The basis for this is the OPC UA synchronization that ensures synchronization of the necessary client information.
- Load compensation;
  Even distribution of OPC clients among the available OPC servers

Configuration

All configuration is performed with STEP 7 or SIMATIC NCM PC, V5.5 SP1 or higher. The NCM PC configuration tool is included in the scope of delivery of the corresponding packages.

■ Overview

SIMATIC Basic Panel, Touch Panels (TP), Operator Panels (OP), Mobile Panel, Multifunctional Platforms (MP)[1] and the SIMATIC HMI software package for PC WinCC flexible Runtime support HMI functionality in conjunction with:

- SIMATIC S7
- SIMATIC S5
- SIMATIC 505
- SIMOTION
- SINUMERIK [2]
- Non-Siemens controllers:
  - Allen Bradley - DF1, DH485 and Ethernet IP protocols
  - GE Fanuc - SNP/SNPX protocol
  - LG GLOFA GM - dedicated protocol
  - Mitsubishi - FX and MP 4 protocols
  - Modicon - Modbus RTU and TCP/IP protocols
  - Omron I - Link/MultiLink protocol
  - Telemecanique - UNI-TELWAY protocol

For more detailed information, refer to the WinCC flexible user manual, the "Windows-based systems communication" manual, and the WinCC flexible online help.

[1] For the sake of simplicity, SIMATIC TP/OP/MP is always used in the text below. This is not restrictive, as the information is valid for all systems referred to above. If there are constraints, direct reference is made to them in the text.

[2] Required under WinCC flexible: "SINUMERIK HMI copy license WinCC flexible CE" and "SINUMERIK HMI copy license OA". For configuring, a "SINUMERIK HMI engineering package WinCC flexible" is also necessary.

Note:

Interface options for HMI devices: See the individual device descriptions.

Extended functionality with WinCC flexible

WinCC flexible supports OPC communication for Multi Panel and WinCC flexible Runtime and HTTP communication for all panels with integrated Ethernet interface. Both OPC and HTTP communication can be used in parallel with the process links to SIMATIC S7/S5/505 or non-Siemens PLCs.

OPC Data Access
(MP 277, MP 377, WinCC flexible Runtime only)

OPC Data Access is an open standard for exchanging both local and remote variables between various applications via Industrial Ethernet. The original version of OPC is based on Microsoft COM/DCOM and, therefore, requires a Microsoft Windows-based PC operating system (not Windows CE) on both clients and servers. As OPC XML, communication is based on the Internet standard SOAP/XML and is, therefore, suitable for embedded systems with Windows CE.
Options that are required: WinCC flexible/OPC server

HTTP communication for the variable exchange between SIMATIC HMI systems

(only TP 177B DP/PN, OP 177B DP/PN, Mobile Panel 177 PN, TP 277, OP 277, Mobile Panel 277, Mobile Panel 277 IWLAN, MP 277, MP 377, WinCC flexible Runtime)

Communication based on HTTP message frames enables variables to be exchanged between SIMATIC HMI systems.
Options that are required: WinCC flexible/Sm@rt Access

SIMATIC S7

3

■ **Overview**

The following types of interface are supported in respect of the link between SIMATIC HMI Panels and SIMATIC WinCC flexible Runtime with SIMATIC S7:

- PPI interface:
  Interface between SIMATIC HMI Panels and SIMATIC S7-200 via PPI. Communication runs on the PPI protocol, a standard FB as with SIMATIC S5 is not required.

- MPI interface:
  Interface between SIMATIC HMI Panels and SIMATIC S7 via the integrated PPI interface with S7-200 or MPI interface with S7-300/-400 or alternatively via the MPI interface of a separate interface module and the backplane bus to the SIMATIC S7-CPU. Communication runs on the MPI protocol (PG/OP communication), a standard FB as with SIMATIC S5 is not required.

- PROFIBUS interface:
  Interface between SIMATIC HMI Panels and SIMATIC S7 via the integrated PROFIBUS interface on the CPU or alternatively via the PROFIBUS interface on a separate interface module and the backplane bus to the SIMATIC S7-CPU. Communication runs on the MPI protocol (PG/OP communication), a standard FB as with SIMATIC S5 is not required.

- PROFINET interface:
  Interface between SIMATIC HMI Panels and SIMATIC S7 via the integrated PROFINET interface on the CPU or alternatively via the Industrial Ethernet interface on a separate interface module and the backplane bus to the SIMATIC S7-CPU. Communication runs on the MPI protocol (PG/OP communication), a standard FB as with SIMATIC S5 is not required.

The maximum possible number of S7 connections of a CPU is determined by its power (see Catalog ST 70); from the point of view of SIMATIC HMI Panels the following restrictions apply:

- OP 73micro, TP 177micro: 1 connection
- OP 73: max. 2 connections
- OP 77A, TP 177A, Basic Panel, OP 77B, TP177B, OP 177B, Mobile Panel 177: max. 4 connections
- TP 277, OP 277; Mobile Panel 277, MP 177, MP 277, MP 377: max. 6 connections
- PC with WinCC flexible Runtime: max. 8 connections

PPI interface

From the point of view of the concept, the PPI interface is a point-to-point connection between a SIMATIC HMI Panel (PPI master) or alternatively a PG (PPI master), and an S7-200 (PPI slave).

MPI interface/PROFIBUS interface/Industrial Ethernet interface

The multipoint-enabled communication interfaces of SIMATIC HMI Panels and SIMATIC S7 are used. Options are:

- Interface between one or a number of SIMATIC HMI Panels (MPI master) and one or a number of S7-1200/300/400s or WinAC (MPI master).
  (possible network topology: **MPI/PROFIBUS/Industrial Ethernet**)

- Interface between one or a number of SIMATIC HMI Panels (MPI master) and one or a number of S7-200s (MPI slave) [1]
  (possible network topology: **PPI/MPI/PROFIBUS**)

Unlike PPI connections, MPI connections are static connections that are set up during booting and then monitored.

The original format of a master/master link has in the meantime been joined by a master/slave link, which has enabled integration of the S7-200 (except CPU 212). [1]

In principle this type of information exchange between SIMATIC HMI Panels and SIMATIC S7 is independent of the network used, PPI, MPI, PROFIBUS or Industrial Ethernet: SIMATIC HMI Panels are S7 clients and SIMATIC S7 CPUs are S7 servers.

[1] Constraints with regard to baud rate for S7-200; see Catalog ST 70.

● System interface possible

– System interface not possible

1) Can only be interfaced with max. 1 x S7-200 via PPI (PPI); network operation (parallel PG, etc.) possible
2) Not Basic Panel PN, Mobile Panel 177 PN, Mobile Panel 277 IWLAN;
   Mobile Panel 177 DP, Mobile Panel 277 connection via special connecting cable and junction box (see Mobile Panel);
   Please refer to the manual for cable assignment
3) Connection via integrated MPI/PROFIBUS interface; use the CP 5611 A2 with a standard PC.
4) Max. transmission rate 1.5 Mbit/s
5) Only on passive S7-200; OP 77B (MPI) also on active S7-200
6) Only OP 77B (MPI)
7) Only Basic Panel PN, TP 177B DP/PN, OP 177B DP/PN, Mobile Panel 177 PN
8) Mobile Panel 177 PN, Mobile Panel 277 connection via special connecting cable and junction box (see Mobile Panel);
   Please refer to the manual for cable assignment
9) Mobile Panel 277 IWLAN (wireless interface, see Mobile Panel)
10) Connection via integrated Industrial Ethernet interface; use the CP 1612 with a standard PC
11) MPI cable 6ES7 901-0BF00-0AA0 (max. 187.5 kbit/s) included in PG scope of delivery (for download and test purposes only)
12) Bus connector 6GK1 500-0EA02

3

Overview

PC-based visualization software for single-user systems directly at the machine.

- Runs under Windows XP Professional and Windows 7 Professional, Ultimate, Enterprise
- Current version: SIMATIC WinCC flexible 2008 Runtime with Service Pack 2

SIMATIC WinCC flexible Runtime is configured with the SIMATIC WinCC flexible Advanced configuration software.

Benefits

- Optimum price/performance ratio thanks to individually scalable system functionality
- Functions for all visualization tasks:
  Operator functions, graphical and trend displays, signaling system, log system, archiving (option), recipe management (option), Audit Trail (option), process fault diagnostics (option)
- Flexible runtime functionality thanks to Visual Basic scripts
- Innovative service concepts with remote operation, diagnostics and administration via intranet and Internet as well as e-mail communication to increase availability (option)
- Support for simple distributed automation solutions based on TCP/IP networks at the machine level (option)

Integration

SIMATIC WinCC flexible Runtime supports linking to:

Protocol	PC interfaces
SIMATIC S7 via PPI	
S7-200	CP 5512 [2] CP 5611 A2 [2] CP 5621 [1] CP 5613 A2 CP 5614 A2 CP 5623 CP 5624 PC/PPI adapter [3]

Non-Siemens controllerser

[1] WinCC flexible Runtime is passive (DP slave); the function block required for the link is included in the scope of delivery of WinCC flexible

[2] For Microbox 427 and Panel PC 477/577/677 via internal MPI/DP interface

[3] Only point-to-point to S7-200; no configuration download, operating systems: Windows 2000/XP; Order number: 6ES7 901-3CB30-0AX0

[4] Constraint with regard to baud rate for S7-200; see Catalog ST 70

[5] WinCC flexible RT is active; communication with S7 functions

[6] Only point-to-point to S7-300/-400; No configuration download, operating systems: Windows 2000/XP; order number: 6ES7 972-0CB20-0XA0 (USB)

[7] For further information, see Catalog PM 10

[8] "SINUMERIK HMI copy license OA" option required; for further information, see Catalog NC 60

Application note

In parallel with each and every PLC link, WinCC flexible Runtime supports the use of the OPC Client channel; this enables, for example, connection to an SNMP OPC Server for the purpose of visualizing the data stored there. The SNMP OPC Server provides a means of monitoring network components of any type (e.g. switches) which support the SNMP protocol.

SIMATIC WinCC flexible RT

Note:

You can find more information in Catalog ST 80 / ST PC and in the Industry Mall at www.siemens.com/industrymall

SIMATIC WinCC flexible Runtime application example

■ **More information**

Additional information is available in the Internet at:
www.siemens.com/wincc-flexible

3

■ Overview

- PC-based operator control and monitoring system for visualizing and operating processes, production flows, machines and plants in all sectors – from the simple single-user station through to distributed multi-user systems with redundant servers and cross-location solutions with Web clients. WinCC is the information hub for corporation-wide vertical integration.

- The basic system configuration (WinCC basic software) includes industry-standard functions for signaling and acknowledging events, archiving of messages and measured values, logging of all process and configuration data, user administration and visualization.

- The WinCC basic software forms the core of a wide range of different applications. Based on the open programming interfaces, a wide range of WinCC options (from Siemens Industry Automation) and WinCC add-ons have been developed (by Siemens-internal and external partners).

- WinCC can be operated with every PC that meets the given HW requirements. Particularly the SIMATIC Panel PC and SIMATIC Rack PC product range is available for the industrial use of WinCC systems. SIMATIC PCs impress with their powerful PC technology, are designed for round-the-clock operation, and can be operated in both office areas and harsh industrial environments.

- Together with the Panel PC 477B, there are turnkey solutions as WinCC Standard Client and with the SIMATIC HMI IPC477C as WinCC Standard Client or Single Station. (See also Packages and HMI IPC477C)

Current versions:

- **SIMATIC WinCC V7.0 SP2:**
  Executable with
  - Windows 7 (32-bit) Professional, Enterprise, Ultimate
  - Windows XP Professional SP3
  - Windows 2003 Server SP2 and Windows 2003 Server R2 SP2
  - Windows 2008 Server SP2 (32-bit)
    contains the Microsoft SQL Server 2005 SP2
  - Use in virtual environments – for further information, see
    http://support.automation.siemens.com/WW/view/en/ 49370459

- **SIMATIC WinCC V6.2 SP3:**
  Executable with
  - Windows XP Professional
  - Windows 2000 Professional
  - Windows Server 2003 and Windows Server 2003 R2
    Contains the Microsoft SQL Server 2005 SP2

■ Integration

Integration in company-wide solutions (IT and business integration)

WinCC is strictly based on Microsoft technology, which provides for the greatest possible compatibility and integration ability. ActiveX and .net [1] controls support technology and sector-specific expansions. Cross-manufacturer communication is also a simply exercise. The reason: WinCC can be used as an OPC client and server, and in addition to access to current process values, it also supports standards such as OPC HDA (Historical Data Access), OPC Alarm & Events, and OPC XML Data Access. Just as important: Visual Basic for Applications (VBA) for user-specific expansions of the WinCC Graphics Designer and Visual Basic Scripting (VBS) as an easy-to-learn, open runtime language. If desired, professional application developers can also use ANSI-C. And the access to the API programming interfaces is really simple with the Open-Development-Kit ODK.

WinCC integrates a powerful and scalable Historian function based on the Microsoft SQL Server 2005 in the basic system. Thus the user is given all possibilities: from high-performance archiving of current process data, to long-term archiving with high data compression, through to a central information turntable in form of a company-wide Process Historian. With the help of the option Central Archive Server, this can be created within the framework of a WinCC solution. Versatile clients and tools for evaluation, the open interfaces, special options (Connectivity Pack, Connectivity Station, IndustrialDataBridge) provide the basis for an effective IT and business integration.

[1] Only supported by WinCC V7.0

Integration in automation solutions

WinCC is an open process visualization system and offers the option of connecting the most diverse control systems.

Released communication software

Only communication software with the listed (or higher) product versions should be used. Corresponding SIMATIC NET upgrades are available for the upgrading of older versions.

Number of connectable controls

For the number of the connectable controls via Industrial Ethernet CP 1613, the following applies for a message frame length of 512 bytes:

Type of coupling	Number of nodes
SIMATIC S5 Ethernet Layer 4 + TCP/IP	up to 60
SIMATIC S7 Protocol Suite	up to 64
SIMATIC 505 Ethernet Layer 4 + TCP/IP	up to 60

Via PROFIBUS, a maximum of 8 controls with CP 5611 and a maximum of 44 controls with CP 5613 can be connected. With approx. 10 or more controls, the usage of Industrial Ethernet is recommended.

PROFIBUS
Connection options for SIMATIC HMI

SIMATIC WinCC

■ **Integration** (continued)

Mixed mode with different controls

With their multi-protocol stack, the communications processors CP 1613 and CP 5613 allow for the parallel operation of two protocols, e.g. for the mixed operation of different controls via a bus cable. WinCC supports the operation of two similar interface boards only in connection with the channels SIMATIC S5 Ethernet Layer 4 (2 x CP 1613), SIMATIC S7 Protocol Suite (2 x CP 1613, 2 x CP 5613) as well as PROFIBUS DP (4 x CP 5613; each CP 5613 max. 122 slaves). In addition to communication over industrial Ethernet CP 1613 or PROFIBUS CP 5613, one CP 5611 for communication with SIMATIC S7 via MPI can be used in each case.

Client-server communication

The communication between the clients and the server is achieved using the TCP/IP protocol. The construction of a separate PC-LAN is recommended. For small projects with correspondingly small message frame advent, a SIMATIC NET Industrial Ethernet can be used for both process communication (WinCC/Server ↔ PLC) and for the PC-PC communication (WinCC/client ↔ WinCC/server).

Channel-DLL PROFIBUS DP

In accordance with the PROFIBUS standard, DP/slaves are always permanently assigned to a DP master; i.e. a second WinCC station (DP/master) cannot access the same controls (DP/slave) This means that a redundant operation of two WinCC stations is not possible with the use of the PROFIBUS DP coupling.

Connection to controls from other manufacturers:

For the connection of controls from other manufacturers, OPC (OLE for Process Control) is recommended.

Current notes and information about OPC servers from various suppliers can be found at: www.opcfoundation.org

WinCC supports the standards:
- OPC Data Access 2.05a
- OPC Data Access 3.00
- OPC XML Data Access 1.00 (Connectivity Pack/Connectivity Station)
- OPC HDA 1.20 (Connectivity Pack/Connectivity Station)
- OPC A&E 1.10 (Connectivity Pack/Connectivity Station)

Coupling overview

Protocol	Description
SIMATIC S7	
SIMATIC S7 Protocol Suite	Channel DLL for S7 functions via MPI, PROFIBUS or Ethernet Layer 4 + TCP/IP
Cross-manufacturer	
OPC client [1] for DA, XML DA	Channel DLL for OPC communication, WinCC can acquire data from OPC server applications.
OPC server for DA, XML DA, A&E, HDA	Server applications for OPC communication; WinCC provides process data for OPC client
PROFIBUS FMS	Channel DLL for PROFIBUS FMS
PROFIBUS DP	Channel DLL for PROFIBUS DP

[1] Application note:
The parallel usage of the OPC client channel allows, for example, the connection to an SNMP-OPC server for visualization of the data contained there. The SNMP-OPC server enables monitoring of any network components (e.g. switch) that support the protocol SNMP. You can find more information under SIMATIC NET Communications Systems/SNMP OPC Server.

■ **Overview**

The SIMATIC Touch Panel (TP), Operator Panel (OP), Basic Panel, Comfort Panel, Mobile Panel, multifunctional platforms (MP) [1] offer HMI functionality for the control systems:

- SIMATIC S7
- SINUMERIK [2]
- Non-Siemens controllers:
  - Allen Bradley
  - Mitsubishi
  - Modicon
  - Omron

For more detailed information, refer to the WinCC flexible user manual, the "Windows-based systems communication" manual, and the WinCC flexible online help.

[1] For the sake of simplicity, SIMATIC Panel is always used in the text below. This is not restrictive, as the information is valid for all systems referred to above. If there are constraints, direct reference is made to them in the text.

[2] Required under WinCC flexible: "SINUMERIK HMI copy license WinCC flexible CE" and "SINUMERIK HMI copy license OA". For configuring, a "SINUMERIK HMI engineering package WinCC flexible" is also necessary.

OPC communication and HTTP communication are offered for all Panels with an integrated Ethernet interface. Both OPC and HTTP communication can be used in parallel with the process links to SIMATIC S7 or non-Siemens PLCs.

OPC communication

OPC Data Access is an open standard for exchanging both local and remote variables between various applications via Industrial Ethernet. The original version of OPC is based on Microsoft COM/DCOM and, therefore, requires a Microsoft Windows-based PC operating system (not Windows CE) on both clients and servers. As OPC XML, communication is based on the Internet standard SOAP/XML and is, therefore, suitable for embedded systems with Windows CE.

HTTP communication for variable exchange between SIMATIC HMI systems

Communication based on HTTP message frames enables variables to be exchanged between SIMATIC HMI systems.

PROFIBUS
Connection options for SIMATIC HMI
System interfaces with WinCC (TIA Portal)
SIMATIC S7

3

■ Overview

The following types of interface are differentiated in respect of the link between the SIMATIC Panels and SIMATIC S7 controllers:

- PROFINET interface:
  Coupling of SIMATIC Panel to SIMATIC S7 controllers via Industrial Ethernet TCP/IP using the integrated PROFINET interface of the CPU or, alternatively, a PROFINET interface module.

- MPI/PROFIBUS interface:
  Coupling of SIMATIC Panel to SIMATIC S7 controllers via MPI/PROFIBUS using the integrated MPI/PROFIBUS interface of the CPU for S7-300, S7-400 or the integrated PPI interface of the CPU in the case of S7-200 or, alternatively, a PROFIBUS interface module in the case of S7-1200, S7-300 and S7-400.

- PPI interface:
  Coupling of SIMATIC Panel to SIMATIC S7-200 via PPI network using the integrated PPI interface of the CPU

The maximum possible number of S7 connections of one CPU is determined by its performance capacity (see Catalog ST 70); from the point of view of SIMATIC Panel, the following restrictions apply:

- OP 73: max. 2 connections
- OP 77A, TP 177A, Basic Panel, OP 77B, TP177B, OP 177B, Mobile Panel 177: max. 4 connections
- Comfort Panel, TP 277, OP 277; Mobile Panel 277, MP 177, MP 277, MP 377: max. 6 connections
- PC with PC WinCC Runtime Advanced: max. 8 connections

PPI interface

The PPI interface is a point-to-point connection between a SIMATIC Panel (PPI master) or alternatively a PG (PPI master) and an S7-200 (PPI slave).

MPI/PROFIBUS interface or PROFINET interface

The corresponding multipoint-enabled communication interfaces of SIMATIC Panels and SIMATIC S7 are used. The following are possible:

- Interface between one or a number of SIMATIC Panels (MPI master) and one or a number of S7-1200/300/400s or WinAC (MPI master).(possible network topology: MPI/PROFIBUS or Industrial Ethernet, TCP/IP)

- Interface between one or a number of SIMATIC Panels (MPI master) and one or a number of S7-200s (MPI slave) [1] (possible network topology: PPI, MPI/PROFIBUS)

Unlike PPI connections, MPI connections are static connections that are set up during booting and then monitored.

The original format of a master/master link has been joined by a master/slave link, which has enabled integration of the S7-200 (except CPU 212). [1]

In principle this type of information exchange between SIMATIC Panels and SIMATIC S7 is independent of the network used, PPI, MPI/PROFIBUS or Industrial Ethernet: SIMATIC Panels are S7 clients and SIMATIC S7 CPUs are S7 servers.

[1] Constraints with regard to baud rate for S7-200; see Catalog ST 70.

[8] Only on passive S7-200; OP 77B also on active S7-200

[9] Only OP 77B

[10] Can be interfaced via PPI to max. 1 x S7-200 (PPI); network operation (parallel PG, etc) is possible

Note:

You can find detailed information about cable layout in the WinCC online help.

You can find more information in Catalog ST 80 / ST PC and in the Industry Mall at www.siemens.com/industrymall

■ **Overview**

SIMATIC WinCC Runtime Advanced
visualization software

- PC-based HMI solution for single-user systems directly at the machine

- Basic package for visualization, reporting and logging, user administration, can be expanded flexibly with VB scripts

- Basic package expandable by means of option packages

- Can be integrated into automation solutions based on TCP/IP networks

- Expanded service concepts with remote operation, diagnostics and administration over the intranet and Internet in combination with email communication

SIMATIC WinCC Runtime Professional
visualization software

- PC-based operator control and monitoring system for visualization and operator control of processes, production flows, machines and plants in all sectors – from the simple single-user station through to distributed multi-user systems and cross-location solutions with web clients. WinCC Runtime Professional is the information hub for corporation-wide vertical integration.

- Industry-standard functions for signaling and acknowledging events, archiving of messages and measured values, logging of all process and configuration data, user administration, can be expanded flexibly with VB and C scripts

- Basic package expandable by means of option packages

- Also included are APIs for the Runtime to utilize the open programming interfaces

Note:

You can find more information in Catalog ST 80 / ST PC and in the Industry Mall at www.siemens.com/industrymall

PROFIBUS
Connection options for SIMATIC HMI

System interfaces with WinCC (TIA Portal)
WinCC Runtime Communication

■ Overview

SIMATIC WinCC Runtime Advanced

WinCC Advanced is an open visualization system and offers the option of connecting the most diverse control systems.

Number of connectable controllers

WinCC Advanced permits the parallel coupling of up to 8 controllers.

Connection to third-party controllers

The following "Coupling overview" table lists third-party protocols and controllers which are directly supported by WinCC Advanced. Generally it is also possible to connect third-party controllers via OPC (OLE for Process Control).

Current notes and information about OPC servers from many different suppliers can be found at:
www.opcfoundation.org/

WinCC Advanced supports the standards:

- OPC Data Access 2.05a
- OPC XML Data Access 1.00 (client via DCOM/XML gateway)

Coupling overview for WinCC Runtime Advanced

Protocol	Description	PC interface
MPI, PROFIBUS (S7 communication)	Channel for communication via MPI, PROFIBUS with max. 8 x SIMATIC S7 controllers S7-1200 with CM 1243-5 (DP master), S7-300, S7-400, S7-200 (only passive S7-200)	CP 5611 A2 CP 5621 CP 5512 CP 5711 CP 5613 A2 CP 5623

Overview (continued)

SIMATIC WinCC Runtime Professional

WinCC Professional is an open process visualization system and offers the option of connecting the most diverse control systems.

Released communication software

Only communication software with the listed (or higher) product versions should be used. Corresponding SIMATIC NET upgrades are available for the upgrading of older versions.

Number of connectable controllers

With CP 1613, a maximum of 64 S7 controllers can be connected via Industrial Ethernet; with CP 5611 a maximum of 8 and with CP 5613 a maximum of 44 S7 controllers can be connected via PROFIBUS. With approx. 10 or more controllers, the use of Industrial Ethernet is recommended.

Client-server communication

Communication between the clients and the server is implemented using the TCP/IP protocol. The construction of a separate PC-LAN is recommended. For small projects with correspondingly small message frame advent, a SIMATIC NET Industrial Ethernet can be used for both process communication (WinCC/server ↔ PLC) and for PC-PC communication (WinCC/client ↔ WinCC/server)

Connection to third-party controllers

The following "Coupling overview" table lists third-party protocols and controllers which are directly supported by WinCC Professional. Generally it is also possible to connect third-party controllers via OPC (OLE for Process Control).

Current notes and information about OPC servers from many different suppliers can be found at:
www.opcfoundation.org/

WinCC Professional supports the standards:
- OPC Data Access 2.05a
- OPC Data Access 3.00
- OPC XML Data Access 1.00 (Connectivity Pack/Connectivity Station)
- OPC HDA 1.20 (Connectivity Pack/Connectivity Station)
- OPC A&E 1.10 (Connectivity Pack/Connectivity Station)

Overview

- Interconnecting two PROFIBUS DP networks
- The interchange of data between both DP networks takes place by internal copying in the coupler.

Application

The PROFIBUS DP/DP coupler interconnects two PROFIBUS DP networks. Byte data (0 … 244 byte) is transferred from the DP master of the first network to the DP master of another network and vice versa.

The principle corresponds to the hardware wiring of inputs and outputs used today. The coupler has two independent DP interfaces with which the two DP networks are connected.

The DP/DP coupler is a slave on each DP network. The interchange of data between both DP networks takes place by internal copying in the coupler.

Design

The DP/DP transceiver is housed in a 40 mm casing of the S7-300 series. It can be mounted on a standard mounting rail (7.5 mm and 15 mm) as well as on a mounting rail for the S7 design.

The preferred arrangement is upright in a row, side by side, and without clearance.

The transceiver is connected to the PROFIBUS DP networks through an integral 9-pin sub-D connector.

Function

The DP/DP coupler continuously copies the output data from one network to the input data of the other network (and vice versa).

Functions

- Data exchange of up to 244 byte of input and output data of which up to 128 byte can be consistent
- Up to 16 input/output ranges for exchanging data
- If one side fails, the outputs on the other side maintain the previous value
- Support of DPV1 with full diagnostics
- Adjustment of DP/DP coupler either via switch or STEP 7
- Different baud rate settings are possible
- Electrical isolation between the two DP networks
- Power is supplied to both sides

Parameter assignment

The PROFIBUS DP addresses are set via two DIP switches on the top of the coupler.

The coupler is configured either with STEP 7 or with a configuring tool which integrates the DP/DP coupler with the help of a GSD file.

The data length is adjusted with the corresponding configuring tool.

Technical specifications

DP/DP transceiver	
PROFIBUS transmission rate	max. 12 Mbit/s
Interfaces • PROFIBUS DP	9-pin Sub-D connector
Supply voltage	24 V DC
Current consumption typ.	150 mA
Mounting	Upright (DIP switches above)

Perm. ambient conditions
• Operating temperature
  - horizontal mounting
  - all other mounting positions
	
	0 °C … +60 °C
	0 °C … +40 °C

• Transport/storage temperature	-40 °C … +70 °C
• Relative humidity	10-95 % at +25 °C
Design • Dimensions (W x H x D) in mm • Weight	 40 x 127 x 117 approx. 250 g
Degree of protection	IP20

PA network transitions

■ **Overview**

To create a smooth network transition between PROFIBUS DP and PROFIBUS PA, the SIMATIC product range offers two versions: the DP/PA coupler and the PA link.

The following criteria can be applied when choosing the network transition:

- DP/PA coupler:
  For small quantity frameworks (volumes of data) and low timing requirements; limiting of data transfer rate on the PROFIBUS DP to 45.45 kbit/s

- PA link:
  For large number of stations and high cycle time requirements; data transfer rate on the PROFIBUS DP up to 12 Mbit/s

■ **Application**

The two PA routers are based on two versions of the DP/PA coupler:

- Ex [i] DP/PA coupler (max. output current 110 mA) for implementation of PROFIBUS PA networks with a line or tree topology in environments up to Ex zone 1/21, not for redundant architectures (coupler redundancy, ring)

- FDC 1570 DP/PA coupler (max. output current 1 000 mA) for implementation of PROFIBUS PA networks with a line, tree or ring topology in environments up to Ex zone 2/22; can be used for the redundant architectures "Ring" and "Coupler redundancy"

DP/PA couplers are also integral components of the PA link (see design). The PA link connects PROFIBUS DP and PROFIBUS PA together, and decouples the transmission rates. In contrast to the DP/PA coupler which limits the data transmission rate on the PROFIBUS DP to 45.45 kbit/s, the PA link does not influence the performance of the PROFIBUS DP.

The PA link functions as a slave on the PROFIBUS DP and as a master on the PROFIBUS PA. From the viewpoint of the host PROFIBUS DP master, the PA link is a modular slave whose modules are the devices connected on the PROFIBUS PA. Addressing of these devices is carried out indirectly via the PA link that itself only requires one node address. The host PROFIBUS master can scan devices connected to the PA link all at once.

If the router is a DP/PA coupler, the nodes on the PROFIBUS PA are directly addressed by the PROFIBUS DP master (controller). The DP/PA coupler is an electrical node, but is transparent for communication between the master and PA field devices; it therefore does not require setting of parameters or addresses (exception: FDC 157-0 DP/PA coupler used as PROFIBUS diagnostics slave).

PROFIBUS diagnostics with FDC 157-0 DP/PA coupler, configured as PROFIBUS diagnostics slave

FDC 157-0 DP/PA couplers configured as PROFIBUS diagnostics slaves supply extensive diagnostic and status information via PROFIBUS for swift location and clearance of faults:

- I&M (Identification & Maintenance) data
- Current and voltage values on the main cable
- Redundancy status
- Wire breakage
- Short-circuit
- Signal level

To this end, each of these DP/PA couplers FDC 157-0 requires its own PROFIBUS address. This applies independent of use in a PA Link or as a PA router.

The PA link and DP/PA coupler approved for an extended temperature range are available for use in environments up to Ex zone 2/22. Both are operated with 24 V DC. Assembly is on an S7-300 rail with horizontal or vertical alignment.

■ **Design**

Configuration examples for PA link and DP/PA coupler

PA link

The PA link is a modular combination in S7-300 design consisting of the IM 153-2 High Feature PROFIBUS DP interface module (with optional redundancy) and up to 5 DP/PA couplers (FDC 157-0 or Ex [i]).

All components of the PA link are interconnected through the S7 backplane bus. The use of active bus modules as backplane bus allows hot swapping of individual modules and redundancy of the IM 153-2 High Feature PROFIBUS DP interface modules and the FDC 157-0 DP/PA coupler. If redundancy and changes during operation are not required, passive bus connectors can be used instead of active bus modules.

The PS 307 or PS 305 load power supply can be used for the 24 V DC. With a redundant IM 153-2 High Feature interface module for PROFIBUS DP, it is also recommendable to have a redundant 24 V DC supply, e.g. with two PS 307/PS 305 load power supplies.

The PROFIBUS PA bus segments designed with the DP/PA couplers are physically separated as regards current infeed, but form one bus system in communication terms. A PROFIBUS PA ring segment or a PROFIBUS PA line segment with coupler redundancy can be operated on a PA link. Further PROFIBUS PA line segments can be operated on this PA link using individual couplers. The FDC 157-0 DP/PA couplers provided for the ring coupling or coupler redundancy must always be located at the right-hand end of a sequence of up to 5 couplers.

The following basic components are available for configuring the PA link:

• IM 153-2 High Feature interface module for extended temperature range
• DP/PA coupler (Ex [i] and FDC 157-0)
• Components for redundant design and for hot swapping
  - Mounting rail for hot swapping (as an alternative to the standard mounting rail)
  - BM PS/IM for 1 load power supply and 1 IM 153-2 High Feature module, for extended temperature range
  - IM/IM (IM 157) bus module for two IM 153-2 High Feature modules, for redundant and non-redundant design and for extended temperature range
  - BM FDC for 1 DP/PA coupler Ex [i] or FDC 157-0, for extended temperature range (up to 5 DP/PA couplers possible per PA link)
  - BM FDC/FDC for 2 DP/PA couplers FDC 157-0, for extended temperature range

Additive option:

• PS 307 load power supply for 120/230 V AC; 24 V DC, version in 2, 5 or 10 A, or PS 305 load power supply for 24/48/60/110 V DC; 24 V DC, 2 A

Motor starters for operation in the field, high degree of protection

■ Overview

The intelligent, highly flexible M200D PROFIBUS / PROFINET motor starters are the most functional motor starters of the SIRIUS motor starter family in the high degree of protection IP65 for PROFIBUS / PROFINET communication.

They start and protect motors and loads up to 5.5 kW. Direct-on-line and reversing starter variants are available in a mechanical version and also an electronic version (the latter with soft start function).

The particularly robust M200D PROFIBUS / PROFINET motor starters are characterized by numerous functions which can be flexibly parameterized. Their modular design comprises a motor starter module and a communication module.

The M200D PROFINET motor starters enable TIA-integrated parameterization through PROFINET from STEP 7 – in familiar, user-friendly manner with the same look-and-feel as PROFIBUS.

Functionality

- For basic functionality see Chapter 6 "AS-Interface" -->"M200D motor starters" --> "General data" --> "Overview"
- Electronic version also with soft start function
- Robust and widely used M12 connection method for the digital inputs and outputs and the PROFIBUS/PROFINET bus connection
- All four digital inputs and two digital outputs exist in the cyclic process image. This provides complete transparency of the process on the control level
- Full TIA integration: All digital inputs and outputs exist in the cyclic process image and are visible through the bus, providing maximum flexibility and excellent adaptability to the application.
- Flexible assignment of the digital inputs and outputs with all available assignable input actions
- Extensive diagnostics concept using LEDs and through the bus with the TIA-compatible mechanisms
- Expanded diagnostics using data records
- Complete plant monitoring using statistics data record and current value monitoring by means of data records
- Parameterization through PROFIBUS / PROFINET bus with the aid of data records from the user program
- Control of the motor starter using a command data record from the user program
- Removable modular control unit – quicker device replacement and therefore lower costs when device outages occur – since existing wiring is on the control unit and only one device needs to be replaced
- Parameterization in Step 7 HW config using Motor Starter ES (ordering option for start-up software)
- Start-up and diagnostics with the aid of Motor Starter ES (ordering option for start-up software)
- Trace function through Motor Starter ES for optimized start-up and tracking of process and device values

Only with PROFINET:

- Just one bus system from the MES level to the devices – no routers
- More stations on the bus and possible configuration of flexible bus structures
- Automatic re-parameterization in case of device replacement thanks to proximity detection
- Wireless integration of plant segments in difficult environments using WLAN
- Easier expansion of the system thanks to a higher number of stations on the bus and elimination of terminating resistors

M200D motor starter module for PROFIBUS/PROFINET (without communication module)

M200D communication modules for PROFIBUS

Mounting and installation

The M200D PROFINET / PROFINET motor starter comprises a communication module and a motor starter module. Therefore only the motor starter module has to be replaced when replacing devices. This saves time and money. The communication module remains as an active station on the bus and all other system components continue running. This prevents downtime.

The integrated plug-in technology significantly reduces the wiring outlay: Connecting cables can be plugged directly onto the motor starter module. The PROFINET bus is connected cost-effectively using an M12 connection on the device. All versions have identical enclosure dimensions for easier system configuration and conversion.

Overview (continued)

Parameterization and configuration

All motor protection functions, limit values and reactions can be defined by parameterization.

The user has several user-friendly options for parameterization. In addition to parameterization directly from STEP 7, which also permits automatic re-parameterization in case of device replacement, it is possible to use the user-friendly Motor Starter ES start-up software. By connecting a programming device directly to PROFIBUS / PROFINET and the Motor Starter ES start-up software, the devices can also be conveniently programmed from a central point through the bus. Parameters can also be changed during operation from the user program using the data record mechanism so that the function of the motor starter is adapted to the process when required. With the aid of a PC and the Motor Starter ES software, it is also possible to perform the parameterization through the local point-to-point interface on site.

Functions can be flexibly assigned to the digital inputs and outputs, adapting them to all possible conveyor applications. All digital inputs and outputs exist in the cyclic process image. All limit values for monitoring functions and their reactions are parameterizable and therefore adaptable to the application. Consistency with other products of the SIRIUS M200D motor starter range and with the frequency converter and ET 200pro I/O system is assured.

■ **Application**

M200D PROFIBUS / PROFINET motor starters are particularly suitable for fully TIA-integrated, highly automated conveyor applications which meet all needs with regard to the monitoring of devices and systems and preventative maintenance.

Adaptability of the motor starter functions and maximum flexibility of the device enable a broad range of application without any limits. The PROFINET-specific expansions are the best assurance of a future-proof investment.

Motor starters for operation in the field, high degree of protection – Software

■ Overview

Motor Starter ES for parameterization, monitoring, diagnostics
and testing of motor starters

Motor Starter ES is used for start-up, parameterization, diagnostics, documentation and the preventative maintenance of the motor starters in the SIMATIC ET 200S, ET 200pro, ECOFAST and M200D product families.

Interfacing is performed

- through the local interface on the device
- with PROFIBUS DP V1-compatible motor starters from any point in PROFIBUS or in PROFINET (applies for ET 200pro/ECOFAST/M200D)
- with PROFINET-compatible motor starters from any point in PROFINET or PROFIBUS (applies for M200D).

Using Motor Starter ES, the communication-capable motor starters are easily parameterized during start-up, monitored during normal operation and successfully diagnosed for service purposes. Preventative maintenance is supported by a function for reading out diverse statistical data (e.g. operating hours, operating cycles, cut-off currents, etc.). The user is supported during these procedures with comprehensive Help functions and plain text displays.

Motor Starter ES can either be used as a stand-alone program or it can be integrated into STEP 7 via an object manager.

Efficient engineering with three program versions

The Motor Starter ES software program is available in three versions which differ in their user-friendliness, scope of functions and price.

Motor Starter ES	Basic	Standard	Premium
ET 200S High Feature PROFIBUS IM	✓	✓	--
ET 200S High Feature PROFINET IM	✓	✓	--

✓ Function available

-- Function not available

More functions

- Standards-compliant printouts
  The software tool greatly simplifies machine documentation. It enables parameterization printouts according to EN ISO 7200. The elements to be printed are easy to select and group as required.

- Easy creation of typicals
  Typicals can be created for devices and applications with only minimum differences in their parameters. These typicals contain all the parameters which are needed for the parameterization. In addition it is possible to specify which of these parameters are fixed and which can be adapted, e.g. by the startup engineer.

- Teleservice through MPI
  The Motor Starter ES Premium version supports the use of MPI Teleservice (comprising the Teleservice software and various Teleservice adapters) for remote diagnostics of the devices. This facilitates diagnostics and maintenance, and it shortens response times for service purposes.

3

◾ **Overview** (continued)

Types of delivery and license

Motor Starter ES is available as follows:

- Floating license – the license for any one user at any one time
  - authorizes any one user
  - regardless of the number of installations (unlike the single license which may be installed only once)
  - only the actual use of the program has to be licensed
  - trial license (free use of all program functions for 14 days for test and evaluation purposes, included on every product CD, available in the download file of the SIRIUS ES program in the Service&Support portal).

The following delivery versions are also available for Motor Starter ES 2007:

- Upgrade
  Switching from an old to a new version with expanded functions, e.g. upgrade from Motor Starter ES 2006 to Motor Starter ES 2007

- Powerpack
  Special pack for switching within the same software version to a more powerful version with more functionality, e.g. Powerpack Motor Starter ES 2007 for switching from Standard to Premium.

- Software Update Service
  To keep you up to date at all times, we offer a special service which automatically supplies you with all service packs and upgrades.

- License Download
  User-friendly license key download from our Mall (currently only for customers from Germany) as an easy and quick way for you to receive additional licenses for your software.

System requirements

Parameterization, start-up and diagnostics software Motor Starter ES 2007	For ECOFAST Motor Starter, SIMATIC ET 200S High-Feature Starter, SIMATIC ET 200pro Starter and M200D (AS-I Standard, PROFIBUS, PROFINET)
Operating system	Windows XP Professional (Service Pack 2, Service Pack 3), Windows 7 Professional (32 Bit), Enterprise (32 Bit), Ultimate (32 Bit)
Processor	≥ Pentium 800 MHz/≥ 1 GHz (Windows 7)
RAM	≥ 512 Mbyte/≥ 1 GB (Windows 7)
Monitor resolution	≥ 1 024 x 768
Free space on hard disk[1]	≥ 400 MB
CD-ROM/DVD drive	Yes (only when installing from CD)
Serial interface (COM)	Yes
PC cable/parameterization cable/connection cable	Yes
PROFIBUS card/PROFIBUS processor	Optional, for parameterization and diagnostics through PROFIBUS
Ethernet interface/PROFINET card	Optional, for parameterization and diagnostics through PROFINET

[1] Additional free space recommended, e.g. for swap-out file.

Motor starters for operation in the field, high degree of protection – Software

■ Overview

With the SIRIUS motor starter PCS 7 function block library, SIRIUS ET 200S motor starters (direct-on-line and reversing starters, direct-on-line soft starters) can be easily and simply integrated into the SIMATIC PCS 7 process control system. The SIRIUS motor starter PCS 7 function block library contains the diagnostics and driver blocks corresponding to the SIMATIC PCS 7 diagnostics and driver concept as well as the elements (symbols and faceplates) required for operator control and process monitoring.

Integrated functionality for optimal process control for all process control systems

In addition to the general sensor technology, the motor feeder data is increasingly being integrated into the process control system. By integrating the SIRIUS ET 200S motor starter into the process control system, it becomes possible to prevent errors in the motor feeder simply and reliably, or to detect these errors quickly and rectify them. Downtimes are reduced to a minimum or can be prevented before they happen.

For example, the output and display of the key measured values established by the motor starter also represent a good aid to the assessing and monitoring of the current system status.

Easy integration with the PCS 7 function block library

The PCS 7 function block library can be used for simple and user-friendly integration of ET 200S motor starters into the SIMATIC PCS 7 process control system. The focus here is on simple configuration. The function of the blocks is based on the PCS 7 standard libraries and is optimally tailored to the functions of the ET 200S motor starters.

Users who have previously integrated motor feeders into conventional technology via signal blocks and motor or valve blocks or, for example, already have experience with SIMOCODE modules, are easily able to switch to ET 200S motor starters.

All blocks required for the automation systems are provided by the PCS 7 function block library – as are the block symbols and faceplates for the operator station required for monitoring and control.

Motor block for the direct control of the drive

The low-voltage motors started and protected by ET 200S motor starters (direct on-line and reversing starters, direct-on-line soft starters) can be integrated into the process automation via the motor blocks. This means that they form the interface between the process control system and the motors controlled by the ET 200S motor starters.

To reduce the amount of configuration work required, functions for signal processing and technological functions are integrated into one motor block.

The current in the motor feeder is detected by the ET 200S motor starter and monitored by the motor protection. The motor current is accessible from the I&C system via the motor blocks.

The block symbols and faceplates for the motor blocks display the motor feeders on the operator station and provide all the required information for monitoring and control as well as for detailed diagnostics.

Diagnostics blocks for motor starters

The diagnostics blocks are made visible by the messages and errors supplied by the motor starter. A key advantage of this is that the motor feeder can be analyzed in a specific way as required.

The faceplate for the diagnostics is opened from the motor block faceplate.

Faceplate of the motor block

Types of delivery and license

The SIRIUS motor starter PCS 7 function block library supplied on CD-ROM allows the user to run the required engineering software on the engineering station (single license) including the runtime software for executing the AS modules in an automation system (single license). If the AS modules are to be used in additional automation systems, the corresponding number of runtime licenses are required which are supplied without a data carrier.

■ **Overview**

ECOFAST soft starter

Distributed motor starters are used for switching and protecting loads locally. Versions with graded functional scope and with different installation possibilities ensure that both the functional requirements of the process and the constructional boundary conditions of the machine or installation are taken into account.

The following are available

• Single devices for geographically distributed motors and
• Isolated solutions (ET 200pro) for operating mechanisms installed close together.

ECOFAST motor starters are available as reversing starters (mechanical switching) and reversing soft starters (electronic switching), in each case for PROFIBUS DP and AS-Interface.

The ECOFAST motor starters can be installed close to the motor or mounted on the motor.

Brake contacts are available as an option for the starters. Two or four integrated digital inputs enable sensors to be scanned locally.

All starters are equipped throughout with standardized interfaces for data and power according to the ECOFAST specification:

• HanBrid for PROFIBUS DP and insulation piercing method for AS-Interface
• Han Q4/2 for the power supply
• Han 10e for motor connection

The starters can be connected using T pieces for data and T terminal connectors for power to prevent interruption.

Note:
For further information on ECOFAST, the field and power bus methods for decentral installation in IP65, see Chapter 10 "Energy Communication Field Installation System".

The 3RK1 922-3BA00 hand-held device is available for local operation.

Detailed technical specifications of the ECOFAST motor starters can be found in the manual "ECOFAST Motor Starters".

Motor Starter ES software

The Motor Starter ES software serves for the parameterization, monitoring, diagnostics and testing of motor starters.
It can be used in graded power versions for ECOFAST motor starters and for the PROFIBUS DP and
AS-Interface variants (see ECOFAST ES software, page 3/273).

	Mounting plate for ECOFAST Retaining bracket on the motor for fixing the mounted motor starter	**3RK1 911-3AA00**

■ **Overview**

ECOFAST ES for the configuration, calculating and documentation of applications with the ECOFAST motor starter

The ECOFAST system is an open and innovative system solution for distributed applications with standardized components when equipping machines and plants for automation, controls and drives. The system therefore offers a high degree of safety and availability during operation in addition to high time and cost savings during planning and commissioning/installation.

The ECOFAST system uses the ECOFAST motor starter (see Chapter 9 "Motor starters for use in the field, high degree of protection" --> "ECOFAST motor starters"). The components are connected using the ECOFAST connection method (see Chapter 9 "Motor starters for use in the field, high degree of protection" --> "Energy Communication Field Installation System").

The convenient ECOFAST ES configuring software reduces configuring times even further and enables reliable configuring right from the start. ECOFAST ES reduces errors and effort during the configuration, calculation and documentation of applications.

System requirements

ECOFAST ES V 1.4 supports all standard PCs with the Windows operating system. Minimum hardware and software requirements need to be met to work with ECOFAST ES V 1.4; efficient operation is possible with the recommended values.

System requirements	Min.	Recommended
Operating system (with service pack)	Windows 2000 or Windows XP Professional	
Processor	Pentium 800 MHz	Pentium 1000 MHz[1]
Graphics card		
• Resolution	1024 x 768	1280 x 1024
• Colors, number	256	True Color
Main memory	512 MB RAM	> 512 MB RAM
Free space on hard disk	At least 50 MB [2]	
CD-ROM drive[3]		Yes, for the installation of ECOFAST ES V 1.4

[1] More powerful platforms may be necessary when working with options.

[2] Additional free space recommended, e.g. for swap-out file.

[3] CD-ROM drive not required for using ECOFAST ES V 1.4.

PROFIBUS
SIMOCODE 3UF motor management and control devices

SIMOCODE pro 3UF7
General data

■ **Overview**

SIMOCODE pro V with current/voltage measuring module,
failsafe expansion module and operator panel with display

SIMOCODE pro is a flexible, modular motor management system for motors with constant speeds in the low-voltage performance range. It optimizes the connection between I&C and motor feeder, increases plant availability and allows significant savings to be made during the construction, startup, operation and maintenance of a system.

When SIMOCODE pro is installed in the low-voltage switchboard, it is the intelligent interface between the higher-level automation system and the motor feeder and includes the following:
• Multifunctional, solid-state full motor protection which is independent of the automation system
• Integrated control functions instead of hardware for the motor control
• Detailed operating, service and diagnostics data
• Open communication through PROFIBUS DP, the standard for fieldbus systems
• Safety relay function for the failsafe disconnection of motors up to SIL 3 (IEC 61508/62061) or PL e with Category 4 (ISO 13849-1)

SIMOCODE ES is the software package for SIMOCODE pro parameterization, start-up and diagnostics.

Two series

SIMOCODE pro is structured into two functionally tiered series:
• SIMOCODE pro C, a compact system for direct-on-line starters and reversing starters or the actuation of a circuit breaker
• SIMOCODE pro V, a variable system with all control functions and with the possibility of expanding the inputs, outputs and functions of the system at will using expansion modules

Expansion possibilities	SIMOCODE pro C, Basic Unit 1	SIMOCODE pro V, Basic Unit 2 [1]

• Temperature module (max. 1)	--	✓

✓ Available

-- Not available

[1] When an operator panel with display and/or a decoupling module is used, more restrictions on the number of expansion modules connectable per basic unit must be observed, see page 3/286.

[2] The failsafe digital module can be used instead of one of the two digital modules.

Per feeder each system always comprises one basic unit and one separate current measuring module. The two modules are connected together electrically through the system interface with a connection cable and can be mounted mechanically connected as a unit (one behind the other) or separately (side by side). The motor current to be monitored is decisive only for the choice of the current measuring module.

An operator panel for mounting in the control cabinet door is optionally connectable through a second system interface on the basic unit. Both the current measuring module and the operator panel are electrically supplied by the basic unit through the connection cable. More inputs, outputs and functions can be added to basic unit 2 (SIMOCODE pro V) by means of optional expansion modules, thus supplementing the inputs and outputs already existing on the basic unit. With the DM-F Local and DM-F PROFIsafe failsafe digital modules it is also possible to integrate the failsafe disconnection of motors into the SIMOCODE pro V motor management system.

All modules are connected by connection cables. The connection cables are available in various lengths. The maximum distance between the modules (e.g. between the basic unit and the current measuring module) must not exceed 2.5 m. The total length of all the connection cables in a single system must not be more than 3 m.

Connection methods

Selection tables for the SIMOCODE pro motor management system can be found on the pages that follow.

⊕ Screw terminals

3

Benefits

General customer benefits

- Integration of the whole motor feeder into the process control by means of a bus significantly reduces the wiring outlay between the motor feeder and PLC
- Decentralization of the automated processes by means of configurable control and monitoring functions in the feeder saves resources in the automation system and ensures full functionality and protection of the feeder even if the I&C or bus system fails
- The acquisition and monitoring of operational, service and diagnostics data in the feeder and process control system increases plant availability as well as maintenance and service-friendliness of the feeder
- The high degree of modularity allows users to perfectly implement their plant-specific requirements for each motor feeder
- The SIMOCODE pro system offers functionally graded and space-saving solutions for each customer application
- The replacement of the control circuit hardware with integrated control functions reduces the number of hardware components and the amount of wiring required and thus limits stock keeping costs and potential wiring errors.
- The use of solid-state full motor protection permits better utilization of the motors and ensures long-term stability of the tripping characteristic and reliable tripping even after years of service.

Multifunctional, solid-state full motor protection for rated motor currents up to 820 A

SIMOCODE pro offers comprehensive protection of the motor feeder by means of a combination of different, multi-step and delayable protection and monitoring functions:

- Inverse-time delayed solid-state overload protection (CLASS 5 to 40)
- Thermistor motor protection
- Phase failure/unbalance protection
- Stall protection
- Monitoring of adjustable limit values for the motor current
- Voltage and power monitoring
- Monitoring of the power factor (motor idling/load shedding)
- Ground-fault monitoring
- Temperature monitoring, e.g. over PT100/PT1000
- Monitoring of operating hours, downtime and number of starts, etc.

Recording of measuring curves

SIMOCODE pro can record measuring curves and therefore is able, for example, to present the progression of motor current during motor start-up.

Flexible motor control by integrated control functions (instead of comprehensive hardware interlocks)

Many predefined motor control functions have already been integrated into SIMOCODE pro, including all necessary logic operations and interlocks:

- Overload relays
- Direct-on-line and reversing starters
- Wye/delta starters (also with direction reversal)
- Two speeds, motors with separate windings (pole-changing switch); also with direction reversal
- Two speeds, motors with separate Dahlander windings (also with direction reversal)
- Positioner actuation
- Solenoid valve actuation
- Actuation of a circuit breaker
- Soft starter actuation (also with direction reversal)

These control functions are predefined in SIMOCODE pro and can be freely assigned to the inputs and outputs of the device (including PROFIBUS DP).

These predefined control functions can also be flexibly adapted to each customized configuration of a motor feeder by means of freely configurable logic modules (truth tables, counters, timers, edge evaluation, etc.) and with the aid of standard functions (power failure monitoring, emergency start, external faults, etc.), without additional auxiliary relays being necessary in the control circuit.

SIMOCODE pro dispenses with a lot of additional hardware and wiring in the control circuit, which results in a high level of standardization of the motor feeder in terms of its design and circuit diagrams.

Detailed operational, service and diagnostics data

SIMOCODE pro makes different operational, service and diagnostics data available and helps to detect potential faults in time and to prevent them by means of preventative measures. In the event of a malfunction, a fault can be diagnosed, localized and rectified very quickly – downtimes are avoided or kept to a minimum.

Operating data

- Motor switching state derived from the current flow in the main circuit
- All phase currents
- All phase voltages and phase-to-phase voltages
- Active power, apparent power and power factor
- Phase unbalance and phase sequence
- Time to trip
- Motor temperature
- Remaining cooling time, etc.

Service data

- Motor operating hours
- Motor downtimes
- Number of motor starts
- Number of overload trips
- Interval for compulsory testing of the enabling circuits
- Consumed power
- Internal comments stored in the device, etc.

Diagnostics data

- Numerous detailed early warning and fault messages
- Internal device fault logging with time stamp
- Time stamping of freely selectable status, alarm or fault messages, etc.

PROFIBUS
SIMOCODE 3UF motor management and control devices

SIMOCODE pro 3UF7
General data

3

■ **Benefits** (continued)

Easy operation and diagnostics

Operator panel

The operator panel is used to control the motor feeder and can replace all conventional pushbuttons and indicator lights to save space. It makes SIMOCODE pro or the feeder directly operable in the control cabinet. It features all the status LEDs available on the basic unit and externalizes the system interface for simple parameterization or diagnosis on a PC/PG.

Operator panel with display

As an alternative to the 3UF7 20 standard operator panel for SIMOCODE pro V there is also an operator panel with display: the 3UF7 21 is also able to indicate current measured values, operational and diagnostics data or status information of the motor feeder at the control cabinet. The pushbuttons of the operator panel can be used to control the motor while at the same time the display indicates current measured values, status information, fault messages or the device-internal fault protocol. Using the display settings each user can select for himself how the measured values are presented as standard and how the displayed unit is converted (e.g. °C -> °F).

Communication

SIMOCODE pro is equipped with an integral PROFIBUS DP interface (SUB-D or terminal connection) and can therefore replace all individual wiring (including marshalling racks), which would usually be required for exchanging data with the higher-level automation system, with a single 2-wire cable.

In conjunction with a failsafe controller (F-CPU), the DM-F PROFIsafe failsafe digital module also enables failsafe disconnection through the same PROFIBUS with the PROFIsafe profile.

SIMOCODE pro supports among other things:
- Baud rates up to 12 Mbit/s
- Automatic baud rate detection
- Communication with up to 3 masters
- Time synchronization over PROFIBUS (SIMATIC S7)
- Time stamp with high timing precision (SIMATIC S7)
- Cyclic services (DPV0) and acyclic services (DPV1)
- DPV1 communication after the Y-Link
- Failsafe communication through PROFIBUS/PROFIsafe in conjunction with the
  DM-F PROFIsafe (F-DO) failsafe digital module, etc.

Notes:
For SIMOCODE pro motor management and control devices with communication function see page 3/288 onwards.
For accessories see page 3/291 onwards.
For more information see Catalog IC 10 "Parameterization, Configuration and Visualizing for SIRIUS".

Autonomous operation

An essential feature of SIMOCODE pro is independent execution of all protection and control functions even if communication with the I&C system breaks down. If the bus or automation system fails, the full functionality of the feeder is ensured or a pre-defined response can be initiated, e.g. the feeder can be shut down in a controlled manner or certain configured control mechanisms can be performed (e.g. the direction of rotation can be reversed).

SIMOCODE pro is designed for mixed operation

Depending on functional requirements, the two systems can be used simultaneously without any problems and without any additional outlay in a low-voltage system. SIMOCODE pro C is fully upward-compatible to SIMOCODE pro V. The same components are used. The parameterization of SIMOCODE pro C can be transferred without any problems. Both systems have the same removable terminals and the same terminal designations.

■ **Benefits** (continued)

SIMOCODE pro combines all essential functions, including safety functions,
through PROFIBUS/PROFIsafe for the motor feeder

3

Applications

SIMOCODE pro is often used for automated processes where plant downtimes are very expensive (e.g. steel or cement industry) and where it is important to prevent plant downtimes through detailed operational, service and diagnostics data or to localize any faults very quickly.

SIMOCODE pro is modular and space-saving and especially suited for operation in motor control centers (MCC) in the process industry and for power plant technology.

Applications

Protection and control of motors
- in potentially explosive areas for types of protection EEx e/d according to ATEX directive 94/9/EC
- with heavy starting (paper, cement, metal and water industries)
- in high-availability plants (chemical, oil, raw material processing industry, power plants)

Note:
For more information on the subject "protection and control of motors in potentially explosive areas" see Catalog IC 10, Chapter "Appendix" --> "Standards and Approvals" --> "Ex Protection Certificates for SIRIUS Controls".

Safety technology for SIMOCODE pro

The safe disconnection of motors, in the process industry in particular, is becoming increasingly important as a result of new and revised standards and requirements in the safety technology field.

With the DM-F Local and DM-F PROFIsafe failsafe expansion modules it is easy to integrate functions for failsafe disconnection into the SIMOCODE pro V motor management system while retaining service-proven concepts. The strict separation of safety functions and operational functions proves particularly advantageous for planning, configuration and construction. Seamless integration into the motor management system leads to greater transparency for diagnostics and during operation of the system.

Suitable components for this purpose are the DM-F Local and DM-F PROFIsafe failsafe expansion modules, depending on the requirements:
- the DM-F Local failsafe digital module for when direct assignment between a failsafe hardware disconnect signal and a motor feeder is required, or
- the DM-F PROFIsafe failsafe digital module for when a failsafe controller (F-CPU) creates the signal for the disconnection and transmits it in a failsafe manner through PROFIBUS/PROFIsafe to the motor management system

More information

Configuration instructions when using an operator panel with display and/or a decoupling module

If you want to use an operator panel with display and/or a decoupling module in the SIMOCODE pro V system, then the following configuration instructions concerning the type and number of connectable expansion modules must be observed.

The following tables show the maximum possible configuration of the expansion modules for the various combinations.

The DM-F Local and DM-F PROFIsafe failsafe expansion modules behave like digital modules for standard applications in this situation.

Use of an operator panel with display

Digital module	Digital module	Analog module	Temperature module	Ground-fault module
Only operator panel with display for basic unit 2 (24 V DC or 110 ... 240 V AC/DC)				
Max. 4 expansion modules can be used				
Operator panel with display and current/voltage measurement with basic unit 2 (110 ... 240 V AC/DC)

[3] Analog module output is not used.

Protective separation

All circuits in SIMOCODE pro are safely separated from each other according to IEC 60947-1. That is, they are designed with double creepages and clearances. In the event of a fault, therefore, no parasitic voltages can arise in neighboring circuits. The instructions of Test Report No. 2668 must be complied with.

Types of protection EEx e and EEx d

The overload protection and the thermistor motor protection of the SIMOCODE pro system comply with the requirements for overload protection of explosion-protected motors to the type of protection:
• EEx d "flameproof enclosure" e.g. according to EN 50018 or EN 60079-1
• EEx e "increased safety" e.g. according to EN 50019 or EN 60079-7.

When using SIMOCODE pro devices with a 24 V DC control voltage, electrical separation must be ensured using a battery or a safety transformer according to EN 61558-2-6. EC type test certificate: BVS 06 ATEX F 001
Test report: BVS PP 05.2029 EG.

ATEX approval for operation in areas subject to explosion hazard

The SIRIUS SIMOCODE pro 3UF7 motor management system is certified for the protection of motors in areas subject to explosion hazard according to
• ATEX Ex I (M2); equipment group I, category M2 (mining)
• ATEX Ex II (2) GD; equipment group II, category 2 in area GD

See Catalog IC 10 "Appendix" --> "Standards and Approvals" --> "Ex Protection Certificates for SIRIUS Controls".

Selection data for type-tested assemblies/load feeders

Configuration tables according to type of coordination 1 or 2 can be found in the manual "SIRIUS Configuration", Order No.: 3ZX1 012-0RA21-0AB0, the manual "Configuring SIRIUS Innovations", order no.: 3ZX1012-0RA21-1AB0 or the system manual SIMOCODE pro.

System manual

The SIMOCODE pro system manual describes the motor management system and its functions in detail. It provides information on configuration, start-up, servicing and maintenance. A typical example of a reversing starter application is used to teach the user quickly and practically how to use the system. In addition to help on how to identify and rectify faults in the event of a malfunction, the manual also contains special information for servicing and maintenance. For the selection of equipment and for configuration, it is recommended that the 3UF7 970-0AA0.-0 system manual be consulted.

A detailed description of the DM-F Local and DM-F PROFIsafe failsafe expansion modules is provided in the system manual "SIMOCODE pro Safety Failsafe Digital Modules", which can be downloaded from the Internet.

Expansion modules for SIMOCODE pro V

With SIMOCODE pro V, it is possible to expand the type and number of inputs and outputs in steps. Each expansion module has two system interfaces on the front. Through the one system interface the expansion module is connected to the system interface of the SIMOCODE pro V using a connection cable; through the second system interface, further expansion modules or the operator panel can be connected. The power supply for the expansion modules is provided by the connection cable through basic unit 2.

Note:

Please order connection cable separately, see page 3/291.

3UF7 300-1AU00-0

Digital modules

Up to two digital modules can be used to add additional binary inputs and relay outputs to the basic unit. The input circuits of the digital modules are supplied from an external power supply.

4 binary inputs and 2 relay outputs,

up to 2 digital modules can be connected per basic unit 2

Relay outputs	*Input voltage*	
Monostable	24 V DC	**3UF7 300-1AB00-0**
	110 ... 240 V AC/DC	**3UF7 300-1AU00-0**
Bistable	24 V DC	**3UF7 310-1AB00-0**
	110 ... 240 V AC/DC	**3UF7 310-1AU00-0**

3UF7 400-1AA00-0

Analog module

The basic unit can be optionally expanded with analog inputs and outputs (0/4 ... 20 mA) by means of the analog module.

2 inputs (passive) for input and 1 output for output of 0/4 ... 20 mA signals, max. 1 analog module can be connected per basic unit 2.

3UF7 400-1AA00-0

3UF7 500-1AA00-0

Ground-fault module

Instead of ground-fault monitoring using the current measuring modules or current/voltage measuring modules, it may be necessary, especially in high-impedance grounded networks, to implement ground-fault monitoring for smaller ground fault currents using a summation current transformer.

1 input for connecting a summation current transformer 3UL22, up to 1 ground-fault module can be connected per basic unit 2

Note:

For related summation current transformers for rated fault currents 0.3 A, 0.5 A or 1 A see Catalog IC 10.

3UF7 500-1AA00-0

3UF7 700-1AA00-0

Temperature module

Independently of the thermistor motor protection of the basic units, up to 3 analog temperature sensors can be evaluated using a temperature module.

Sensor types: PT100/PT1000, KTY83/KTY84 or NTC

3 inputs for connecting up to 3 analog temperature sensors, up to 1 temperature module can be connected per basic unit 2

Failsafe expansion modules for SIMOCODE pro V

Thanks to the failsafe expansion modules,
SIMOCODE pro V can be expanded by adding the function of a safety relay
for the failsafe disconnection of motors. A maximum of 1 failsafe digital module
can be connected; it can be used instead of a digital module.

The failsafe expansion modules, too, are equipped with two system interfaces
at the front for making the connection to other system components.
Unlike other expansion modules, power is supplied to the modules through a
separate terminal connection.

Note:

Please order connection cable separately, see page 3/291.

Overview

The 3UF18 current transformers are protection transformers and are used for actuating overload relays. Protection transformers are designed to ensure proportional current transfer up to a multiple of the primary rated current. The 3UF18 current transformers convert the maximum current of the corresponding operating range into the standard value of 1 A secondary.

PROFIBUS
3RK3 modular safety system

General data

Overview

SIRIUS 3RK3 modular safety system

The 3RK3 modular safety system (MSS) is a freely parameterizable modular safety relay. Depending on the external circuit version, safety-oriented applications up to Category 4 according to EN 954-1, Performance Level e according to ISO 13849-1 or SIL3 according to IEC 62061 can be realized.

The modular safety relay enables the interconnection of several safety applications. Using the MSS ES graphical parameterization tool it is very easy to create the safety functions as well as their logical links on the PC. For example disconnection ranges, ON-delays, OFF-delays and other dependencies can be defined.

With the optional expansion modules, both safety-related and standard, the system is flexibly adapted to the required safety applications.

The MSS comprises the following system components:
• Central module
• Expansion modules
• Interface module
• Diagnostics module
• Parameterization software
• Accessories

The comprehensive error and status diagnostics provides the possibility of finding errors in the system and localizing signals from sensors. Plant downtimes can be reduced as a result.

The optional PROFIBUS DP interface module transfers diagnostics data to higher-level bus systems (e.g. PROFIBUS DP). These data are then available for further processing in the automation system.

Connection methods

On the following pages you will find selection tables for the modular safety system.

PROFIBUS
Energy management

PC-based energy management system

■ Overview

Components of the PC-based energy management system

User interface of powermanager

Energy management system with the SENTRON product family

The SENTRON product family offers the user not only power management software in the form of SENTRON powermanager but also the corresponding hardware in the form of SENTRON measuring devices and 3WL/3VL circuit breakers for the realization of a complete energy management system.

The components are optimally coordinated with each other. For example, special drivers for the SENTRON devices are integrated in the powermanager software so that on the one hand the power data acquisition can take place without any great configuration effort and, on the other hand, the most important measured values or states are indicated by predefined displays.

This reduces the engineering work for the customer and gives the user the assurance of knowing that the device functions are optimally supported in the software.

Energy management software powermanager

The energy management software powermanager is at the heart of the PC-based energy management system and

- is independent energy management software
- can be operated using a PC and measuring devices with Ethernet connection.
- is expandable from the simple standard application to a fully flexible customer solution.
- is fully scalable with regard to the number of devices and to the software's functions
- ensures the optimum integration of measuring devices from the 7KM PAC range, 3WL/3VL circuit breakers and other devices.

The powermanager energy management software includes a client/server installation for recording, preparing, displaying and archiving power data. These power data are supplied primarily by 7KM PAC measuring devices or 3WL/3VL circuit breakers, which are connected to the system through Ethernet.

The powermanager software is available in the "Expert", "Web" and "Distributed Systems" option packs.

■ Benefits

- Transparency of power flows
- Exact knowledge of the consumption profile
- Increase of power efficiency
- Optimization of power supply contracts
- Compliance with contractual terms
- Assignment of power costs to cost centers
- Optimization of plant maintenance
- Identification of critical plant conditions

■ Application

The PC-based energy management system is used wherever power flows need to be transparently displayed and monitored.

Industries

Energy efficiency thanks to power management with consistent monitoring and the resulting optimisation measures is important for all industries, e.g. in the manufacturing industry, in non-residential buildings, in the field of services, and in infrastructure projects. This has a particular impact on competitiveness, particularly in view of rising energy prices.

System configuration with powermanager

- Integration of measuring devices by means of predefined device templates for the 7KM PAC family and the 3WL/3VL circuit breakers
- Easy integration of existing modbus-capable detecting devices
- Communication through Standard Ethernet
- Integration of devices with RS485 interface (ModbusRTU) through Modbus gateway, e.g. the 7KM PAC4200 can be used as gateway

Applications (continued)

NSH0_00060c

SIMATIC-based solutions for the process and manufacturing industry

Besides the high level of automation, a key feature of the process and manufacturing industry is a very high power consumption. It is only natural, therefore, to integrate an energy management system in the existing systems.
The add-on SIMATIC powerrate for WinCC and PCS 7 makes it possible to provide transparency and control in power distribution and energy costs.

Integration of switching, safety and measuring devices

For complete integration of low-voltage power distribution components in process and SCADA systems, PROFIBUS DP interfaces and function block libraries are available, e.g. the PAC3200 function block library for SIMATIC WinCC and PCS 7. The software add-ons can therefore be used to display all the data supplied from the devices without major engineering work.

PROFINET and PROFIenergy

An increasing number of devices in automation technology offer PROFINET. There is also a Switched Ethernet PROFINET module for the 7KM PAC3200 and PAC4200 measuring device. PROFIenergy is a "Common Application Profile" from the PNO. Thanks to PROFIenergy it is possible to assemble an energy management system with standardized device interfaces.

SIMATIC powerrate

The SIMATIC powerrate software is at the heart of the SIMATIC-based energy management system and

- is an add-on to PCS 7 and WinCC which throws light on power consumption from the infeed to the load.
- continuously collects, archives and processes power data
- creates a load profile and works out potential savings based on exact knowledge of the load profile.
- monitors the contractually agreed power limit.
- enables the exact recording and evaluation of power consumption per batch through batch-related consumption recording.
- enables the monitoring or indication of switch status and, with suitable authorization, remote switching.
- shows selected measurements online and messages from the 7KM PAC3200 and PAC4200 measuring devices
- collects archived data, which can be exported to Excel and presented in various reports.

■ **Benefits**

- Increased energy efficiency due to exact knowledge of the load profile
- Optimization of power supply contracts
- Assignment of power costs to cost centers
- Optimization of plant maintenance
- Identification of critical plant conditions
- Reliable monitoring of the power limit through automatic load management

■ **Application**

The SIMATIC-based energy management system is used wherever power flows need to be transparently displayed and monitored, and also where it is necessary to effectively intervene above the process control level.

Industries

SIMATIC powerrate is used in all areas in which PCS 7 or WinCC is used and energy efficiency considerations play a major role.

3

Overview

Precise measuring with 7KM PAC3100, PAC3200 and PAC4200

The 7KM PAC measuring devices:
PAC3200 (left), PAC3100 (center) and PAC4200 (right)

The 7KM PAC measuring devices are used to measure and indicate all relevant network parameters in low-voltage power distribution. They can be used for single-phase measurements as well as for multiphase measurements in 3 and 4-conductor networks (TN, TT, IT).

Power values for main distribution boards, electrical feeders or individual loads are recorded precisely and reliably, and important measured values are supplied in addition for assessing the state of the plant and the quality of the network.

More information

More information is available on the Internet at:
www.siemens.com/lowvoltage/energymanagement

Benefits

7KM PAC measuring device, general

The common features of all power monitoring devices in the 7KM PAC series:

- Simple mounting and commissioning
- High IP65 degree of protection (front side, when installed) permits usage in extremely dusty and wet environments
- Intuitive operation using 4 function buttons and multilingual plain text displays
- Easy adaptation to different systems using integrated and optional
  - Digital inputs and outputs
  - Communication interfaces
- Worldwide use
  - Min. 8 languages
  - International approvals
  - Developed and tested to European and international standards
- Low mounting depth

7KM PAC3200 and 7KM PAC4200 measuring device

Additional performance characteristics of the 7KM PAC3200 and 7KM PAC4200:

- Precise energy recording
- Versatile system integration
  - Integrated Ethernet interface
  - Optional communication modules available
  - Multifunctional digital inputs and outputs
  - Limit value monitoring
- Can be connected directly to power supply networks up to 690 V AC (UL-L) , CATIII without voltage transformers.
- Easy-to-use configuration software included as standard

7KM PAC4200 measuring device

Additional performance characteristics of the 7KM PAC4200:

- Monitoring the plant status and the system quality
  - Basic information for evaluating network quality
  - Logging of plant history in the form of operation, control and system-related events
- Recording of the power range through power averaging (load profile)
- Daily energy meters for apparent, active and reactive energy across 365 days for cut-off date assessment
- Detection of gas, water, compressed air or other energy sources via pulse counter to the digital inputs
- Can be expanded using modules to up to 10 digital inputs and 6 digital outputs
- Meters for apparent, active and reactive energy for the precise detection of the power consumption of a partial process or manufacturing process
- 10/100 Mbit/s Ethernet interface with gateway function for the easy connection of devices with serial RS485 interface via expansion module PAC RS485 to an Ethernet network
- Comprehensive convenience indicators, such as user-defined displays, bar and status indicators, phase diagram and list and histogram graphics
- Satisfies the accuracy requirements of class 0.2S high-precision meters used by power supply companies according to IEC 62053-22, which are normally reserved for exacting industrial applications

PROFIBUS
7KM PAC measuring devices
Expansion modules
for 7KM PAC measuring devices

Overview

From left to right:
Expansion module 7KM PAC Switched Ethernet PROFINET
Expansion module 7KM PAC PROFIBUS DP
Expansion module 7KM PAC RS485
Expansion module 7KM PAC 4DI/2DO

Expansion modules act as communication interfaces for 7KM measuring devices.

Communication modules are plugged in at the back of the measuring device. The device identifies the module automatically and presents the parameters of relevance for this module for selection in the parameterization menu.

7KM PAC Switched Ethernet PROFINET expansion module

The 7KM PAC Switched Ethernet PROFINET expansion module is a plug-in communication module for the 7KM PAC3200 and PAC4200 measuring devices.

- Standardized PROFIenergy interface to the measured variables.
- The measured variables can be individually selected using a GSDML file. This enables the use of cost-effective S7-CPUs.
- Easy parameter assignment using the device display and STEP 7.
- Integrated Ethernet Switching permits networking with short cables without additional switches.
- Direct integration in production machine networks using IRT (IRT = Isochronous-Real-Time).
- Full support of PROFINET IO (DHC, DNS, SNMP, SNTP).
- Device replacement without PG in the PROFINET network using LLDP.
- Deterministic reversing time through ring redundancy (MRP).
- Modbus TCP for communication with 7KM powermanager or powerconfig.
- 2 x Ethernet (RJ45) sockets.
- Baud rates 10 and 100 Mbit/s.
- Protocols PROFINET IO, PROFIenergy and Modbus TCP.
- No external auxiliary power necessary.
- Additional display via the device display and via LEDs on the module.

All measurement variables from 7KM PAC3200 and PAC4200 are individually selected and cyclically transmitted by means of the GSDML file. This enables optimum use of the process image of the PROFINET controller, e.g. CPU 315-2 PN/DP of SIMATIC S7.

The measured variables can be read out in acyclic mode using PROFIenergy, a PNO protocol profile. Thanks to PROFIenergy it is possible to assemble an energy management system with devices from various manufacturers using PROFINET.

7KM PAC PROFIBUS DP expansion module

The PAC PROFIBUS DP expansion module has the following features:

- Pluggable communication modules for 7KM PAC3200 and PAC4200 measuring devices
- Parameterizable from the front of the device or using parameterization software
- Using PROFIBUS DPV1, data can be transferred in both cyclic and acyclic modes
- Easy engineering thanks to integration into SIMATIC STEP 7 and/or simple integration via GSD file for other programming systems
- Optimum use of process image of a control for selection of individual measurment values for cyclical transfer
- All baud rates from 9.6 kbit/s up to 12 Mbit/s are supported
- Connection through 9-pole Sub-D connector according to IEC 61158
- No external auxiliary power necessary
- Additional display via the device display and via LEDs on the module

PROFIBUS
7KM PAC measuring devices
Expansion modules for 7KM PAC measuring devices

3

■ **Overview** (continued)

7KM PAC RS485 expansion module

The 7KM PAC RS485 expansion module has the following features:

- Pluggable 7KM PAC RS485 communication module for 7KM PAC3200 and PAC4200 measuring devices
- Parameterizable from the front of the device or using parameterization software
- Support for the Modbus RTU protocol
- Plug and play
- Baud rates 4.8 / 9.6 / 19.2 and 38.4 kbit/s are supported.
- Connection by means of 6-pole screw terminals
- No external auxiliary power necessary
- Status indication by LED on the module

The 7KM PAC RS485 expansion module is required for the gateway function of the 7KM PAC4200 to achieve simple devices with RS485 interface, such as the 7KM PAC3100, via Ethernet (Modbus TCP).

7KM PAC 4DI/2DO expansion module

The 7KM PAC 4DI/2DO expansion module is used to expand the 7KM PAC4200 measuring device to up to 10 digital inputs and 6 digital outputs.
It offers the following features:

- Up to two 7KM 4DI/2DO modules can be plugged onto a PAC4200.
- The 7KM PAC 4DI/2DO modules mean that the internal digital inputs and outputs can be expanded by up to 8 inputs and 4 outputs.
- The 4DI/2DO expansion modules can be parameterized via the front of the device or via the powerconfig configuration software.
- The digital inputs can be used without external voltage sources. They are self-powered.
- All functions of the integrated multifunctional inputs/outputs on the 7KM PAC4200 are also available in the 7KM PAC 4DI/2DO expansion module.
- Inputs and outputs can be used as an S0 interface conforming to IEC 62053-31.
- The connection is made via a 9-pole screw terminal.
- No external auxiliary power supply is required.

■ **Overview**

SIMATIC powerrate

SIMATIC WinCC powerrate is an add-on to PCS 7 and WinCC which throws light on power consumption from the infeed to the load.

- Identification of power-intensive consumer devices and processes in order to introduce measures for improving power efficiency
- Comparison of consumption profiles for greater efficiency of process design
- Optimizing the company according to energy parameters based on an assessment of consumption and costs
- Complying with the contractually agreed power limit, thus preventing higher power supply costs or penalty payments.

SIMATIC PCS 7 Library PAC3200, SENTRON PAC3200 function block library for SIMATIC WinCC

The function block libraries enable the seamless integration of the 7KM PAC3200 power monitoring device into the PSC 7 process world or into WinCC.

3WL/3VL function block library for SIMATIC PCS 7

The 3WL/3VL function block library enables the seamless integration of the 3WL/3VL circuit breaker in the PSC 7 process world.

SIMATIC powerrate

Overview

3

SIMATIC powerrate is an add-on to PCS 7 and WinCC which throws light on power consumption from the infeed to the load. Power data are continuously collected, archived and processed further. With an exact knowledge of the consumption profile, it is possible to identify savings potential, optimize your power supply conditions and hence lower your power costs. Monitoring the contractually agreed power limit helps on the one hand to prevent unnecessarily high power prices or penalties and on the other hand to make full use of the fixed power limit.

Batch-related consumption recording enables the exact recording and evaluation of power consumption per batch.

The integration of switches through digital inputs/outputs enables the monitoring or indication of switch status and, with suitable authorization, remote switching. If connection is through DPV1 or PROFINET selected measured values and messages from the 7KM PAC3200 and PAC4200 measuring devices can be displayed online.

Data recorded and archived by SIMATIC powerrate can be exported to Excel and presented in various reports.

Support for the WinCC Web Navigator means that the SIMATIC powerrate functionality is also available over the web.

Full integration in PCS 7 and WinCC makes it easy to use standard interfaces or standard functionalities from PCS 7 or WinCC.

Components

SIMATIC powerrate is made up of the following components:
- Function blocks for the acquisition and processing of power data
- Faceplates for the presentation and processing of power data
- Components for implementing load management (calculating trends, monitoring limits, enabling/disabling loads)
- Function blocks for batch-related consumption recording
- Function blocks for the integration of measuring devices and switches
- Other components, for example for time synchronization, data buffering or data exchange with archives
- Faceplates for presenting results and for entering values (e.g. for configuration or from manual measured values)
- Excel-based reports for allocating power data to cost centers, for batch-related evaluation and for determining and presenting the duration curve
- Exporting data to Excel

System requirements

The SIMATIC powerrate library is released for the following PCS 7 versions:
- SIMATIC PCS 7 V7.1 SP2
- SIMATIC PCS 7 V7.1 SP1
- SIMATIC PCS 7 V7.1

The library is released for the following WinCC version with the associated STEP 7 versions:
- SIMATIC WinCC V7.0 SP2

■ **SIMATIC powerrate**

■ Benefits

- Identification of power-intensive consumer devices and processes in order to introduce measures for improving power efficiency
- Comparison of consumption profiles for greater efficiency of process design
- Optimizing the company according to energy parameters based on an assessment of consumption and costs
- Complying with the contractually agreed power limit, thus preventing higher power supply costs or penalty payments
- Integration of the SENTRON 7KM PAC3200 and PAC4200 measuring devices, with a quick overview of selected measured values and signals
- Integration of switches, with an overview of switch status and switching possibilities
- Exact assignment and comparison of the consumption data of certain work processes through batch-related consumption recording

■ Applications

SIMATIC powerrate is used in all areas in which PCS 7 or WinCC is used and energy efficiency considerations play a major role. Full integration into PCS 7 or WinCC means that there is no need for a special system environment. Predefined modules and symbols give you the assurance of building on tested and certified product components, with interfaces which enable customized expandability.

SIMATIC PCS 7 Library PAC3200

Overview

The PCS 7 function block library – SIMATIC PCS 7 Library PAC3200 – for the 7KM PAC3200 measuring device enables the seamless integration of the measuring device into the PCS 7 process world.

It comprises one driver block, one diagnostics block and the faceplates. The blocks in the SIMATIC S7 supply energy data to the faceplates in the user interface of the process control system, generate signals and guarantee connection to the maintenance system of PCS 7.

Faceplates

Faceplates serve as a user interface for operating and monitoring and enable technologically important values and functions of the 7KM PAC3200 measuring device to be displayed and performed as a PCS 7 object.

Both between the faceplates and the function blocks and between the function blocks and the 7KM PAC3200 measuring device, on the system side there are bidirectional communication connections that support the display of values in the faceplates and the forwarding of input data to the device.

This transforms the 7KM PAC3200 power monitoring device into an integral component of PCS 7.

The operating systems supported are the same as those for the SIMATIC PCS 7.

Benefits

- Full integration of 7KM PAC3200 power monitoring device in the PCS 7 process control system through PROFIBUS DPV1 using a certified PCS 7 add-on module
- Read-out and display of device data
- Input of limit values for monitoring by the driver block
- Resetting of values on the device (min/max values)

Applications

SIMATIC PCS 7 Library PAC3200 is used in all areas in which PCS 7 is used. Full integration in PCS 7 means that there is no need for a separate system environment. Predefined modules and symbols give you the assurance of building on tested and certified product components.

For challenging measurements the 7KM PAC4200 can also be used in the functional scope of the PAC3200.

In addition to the cyclic connection, there is also an acyclic connection for pure visualization tasks. The process image of the SIMATIC CPUs can be used more efficiently with the acyclic connection.

Selection and ordering data

• When using additional PCS 7 OS devices, you need an engineering license for each PCS 7 OS.	
Runtime license	**3ZS2 781-1CC10-6YH0**
• For operation on an additional AS	

[1] For currently-supported SIMATIC PCS 7 versions see http://support.automation.siemens.com

■ Overview

The PCS 7 3WL/3VL function block library enables the simple and seamless integration of the 3WL/3VL circuit breaker into the PSC 7 process world.

It comprises one driver block, one diagnostics block and the faceplates. The blocks in the SIMATIC S7 supply current, power and energy data to the faceplates in the user interface of the process control system, generate signals and guarantee connection to the maintenance system of PCS 7.

Faceplates

Faceplates serve as a user interface for operating and monitoring and make it easy for the circuit breaker to be displayed and operated as a PCS 7 object.

The 3WL/3VL function block library for SIMATIC PCS 7 provides for continual plant transparency. Critical plant states are recognized quickly and costs due to outages avoided. System availability is permanently increased.

This transforms the circuit breaker into an integral component of PCS 7.

The operating systems supported are the same as those for the SIMATIC PCS 7.

■ Benefits

- Full integration of the 3WL/3VL circuit breaker into the PCS 7 process control system through PROFIBUS DPV1 using a certified PCS 7 add-on module
- Remote switching and monitoring
- Read-out of maintenance information
- Automatic information in case of overload, short circuit and faults
- Read-out and display of device data
- Limit monitoring by the driver block
- Resetting of values on the device (min/max values)

■ Applications

The 3WL/3VL function block library for SIMATIC PCS 7 is used in all areas in which PCS 7 is used. Full integration in PCS 7 means that there is no need for a separate system environment. Predefined modules and symbols give you the assurance of building on tested and certified product components.

PROFIBUS
Configuring, visualizing and controlling with SIMATIC

**PAC3200 function block library
for SIMATIC WinCC**

■ Overview

The PAC3200 function block library for SIMATIC WinCC enables the seamless integration of the 7KM PAC3200 power monitoring device into WinCC.

It comprises one driver block, one diagnostics block and the faceplates. The blocks in the SIMATIC S7 supply energy data to the faceplates in the user interface of WinCC, generate signals and guarantee connection to the signaling system of WinCC.

Faceplates

Faceplates serve as a user interface for operating and monitoring and enable technologically important values and functions of the 7KM PAC3200 power monitoring device to be displayed and performed in WinCC.

Both between the faceplates and the function blocks and between the function blocks and the 7KM PAC3200 measuring device, on the system side there are bidirectional communication connections that support the display of values in the faceplates and the forwarding of input data to the device.

This makes the 7KM PAC3200 measuring device an integral component of WinCC.

System requirements

The SENTRON PAC3200 function block library for SIMATIC WinCC is released for

- WinCC V 7.0
- WinCC V 7.0 SP2

WinCC options AS-OS Engineering and Basic Process Control must be installed. The function block library is available for S7-300, S7-400 and WinAC RTX.

At least one S7 CPU317-2DP is required for use in the S7-300 area. At least one S7 CPU414-2 is required for use in the S7-400 area.

Supported operating systems are the same as for SIMATIC WinCC.

■ Benefits

- Full integration of the 7KM PAC3200 measuring device in SIMATIC WinCC through PROFIBUS DPV1 The function block library is a certified WinCC add-on module
- Read-out and display of device data
- Input of limit values for monitoring by the driver block
- Resetting of values on the device (min/max values)

■ Applications

The PAC3200 function block library for SIMATIC WinCC is used in all areas in which WinCC is used. Predefined function blocks and symbols give you the assurance of building on tested and certified product components.

For challenging measurements the 7KM PAC4200 can also be used in the functional scope of the PAC3200.

In addition to the cyclic connection, there is also an acyclic connection for pure visualization tasks. The process image of the SIMATIC CPUs can be used more efficiently with the acyclic connection.

◼ Overview

powermanager

Energy management software for the SENTRON-based energy management system with the following main points:

- to identify savings potential
- to reduce power costs
- to ensure power availability

powerconfig

Commissioning and service tool for communication-capable SENTRON measuring devices and circuit breakers with following main points:

- Makes the parametrization of the devices easier, which gives rise to a considerable time saving, particularly when several devices have to be set up.
- With powerconfig the 3WL and 3VL circuit breakers and the 7KM PAC3100 / PAC3200 / PAC4200 measuring devices can be parameterized, documented, operated and monitored using various communication interfaces.

Application

Applications

The product offers a standard power management solution which provides the user with the following basic functionality:

- Collection of measured quantities from the devices
- Presentation of the measured quantities from the devices in table form in a predefined standard view for 7KM PAC3100, PAC3200 and PAC4200 measuring devices and 3WL/3VL circuit breakers
- Free presentation of measured quantities possible, including from non-Siemens devices using generic Modbus drivers
- Archiving of measured quantities

- Monitoring of status and limits, with generation of corresponding signals
- Reserve curve display for visualizing the achieved data and online data
- Cost center reports based on predefined rates and the archived consumption data
- OPC server
- Configuration of the system including user management

This standard solution is designed with cost-efficiency and simple system start-up in mind.

System configuration

- Integration of measuring devices by means of predefined device templates for the 7KM PAC family and the 3WL/3VL circuit breakers
- Easy integration of existing modbus-capable detecting devices
- Communication through Standard Ethernet
- Integration of devices with RS485 interface (ModbusRTU) through Modbus gateway, e.g. the 7KM PAC4200 can be used as gateway

Industries

Energy efficiency thanks to power management with consistent monitoring and the resulting optimisation measures is important for all industries, e.g. in the manufacturing industry, in non-residential buildings, in the field of services, and in infrastructure projects. This has a particular impact on competitiveness, particularly in view of rising energy prices.

System requirements

Hardware requirements

- Processor: Intel Pentium IV 2.8 GHz (or better)
- RAM: at least 2 GB
- Hard disk: at least 1 GB free
- Graphics: VGA with at least 1280 x 1024 pixels and 16-bit color intensity

Supported operating systems

- Windows Vista: Business, Ultimate; SP1
- Windows XP: XP with SP2/SP3
- Windows 2003: Server 2003 Server (32-bit)

Supported Excel versions (required for reporting)

Excel 2000, Excel XP, Excel 2003, Excel 2007

■ **Overview**

Setting the parameters of a SENTRON device

Display of current measured variables (harmonic)

The powerconfig software is the new combined commissioning and service tool for communication-capable SENTRON measuring devices and circuit breakers.

The PC-based tool makes the parametrization of the devices easier, which gives rise to a considerable time saving, particularly when several devices have to be set up.

With powerconfig the 3WL and 3VL circuit breakers and the SENTRON measuring devices with expansion modules can be parameterized, documented, operated and monitored using various communication interfaces.

■ **Benefits**

Parameterization, documentation, operation and monitoring in one software

• Documentation of measured values and settings

• Clear presentation of the available parameters including plausibility testing of the inputs

• Display of the available device statuses and measured values in standardized views

• Project-oriented storage of device data

• Consistent operation and usability

• Support of the various device communication interfaces (Modbus RTU, Modbus TCP)

• Supported languages: English and German

• Read-out and saving of device recordings (device-dependent)

• Update of the device firmware and loading of language packs (device-dependent)

• No programming knowledge required for operation

• Communication via PROFIBUS and PROFINET and connection to STEP 7 (in preparation)

■ **Application**

System requirements

Hardware requirements

• Processor: Intel Pentium III, 1 GHz (or better)

• RAM: at least 512 MB

• Hard disk: at least 1 GB free

• Color monitor with a minimum resolution of 1024 x 768 pixels

Supported operating systems

• Microsoft Windows XP Prof. 32Bit SP3. MUL OS

• Microsoft Windows 7 Professional (32Bit)

• Microsoft Windows 7 Ultimate (32Bit)

• Microsoft Windows 7 Home Basic (32Bit)

Required framework:

• Microsoft .NET V3.5 SP1

■ **More information**

powerconfig is available free of charge at
http://support.automation.siemens.com/WW/view/en/50241697

You can find more information on the Internet at:

PROFIBUS
SIMATIC identification systems

Communication modules
ASM 456, SIMATIC RF160C

Overview

ASM 456 communication module, SIMATIC RF160C

The cost-efficient ASM 456 and SIMATIC RF160C communication modules are stand-alone PROFIBUS DP slaves used to operate the RFID systems MOBY D/U and SIMATIC RF200 / RF300 / RF600 as well as the MV400 code reading systems via PROFIBUS DP:

- SIMATIC S7 (including FB/FC software)
- SINUMERIK
- PC, IPC, non-Siemens PLC
- SIMOTION (with integrated software library)

Thanks to their high degree of protection and ruggedness, they are particularly suitable for machine-level use. The modular structure with different PROFIBUS connection systems allows them to be used in all applications. The uniform plug-in connection system ensures rapid commissioning.

Overview

The SIMATIC VS130-2 has been specially developed for reading Data Matrix Codes (DMC) ECC200 in industrial environments. It can, however, also read other 2D codes and 1D codes.

The SIMATIC VS130-2 combines industry-standard code reading with industry-standard communication – PROFIBUS and PROFINET (optionally). The reader is perfectly integrated into the SIMATIC S7 automation environment using a standardized function block

The SIMATIC VS130-2 reads codes on many different components and surfaces, such as paper or plastic labels, plastic parts, printed circuit boards, metallic objects.

The SIMATIC VS130-2 reads codes of marked using different methods, e.g. printed, punched, lasered, drilled.

No parameters have to be entered by the user for adapting to the different carrier materials and marking types. "Training" is performed automatically by presenting a readable code pattern. Programming and parameterization are not required.

The user parameterizes the SIMATIC VS130-2 by means of a web-based user interface which runs on various platforms with the following requirements: Browser (IE5.5 and higher), JAVA-VM (MS, SUN).

The web-based operator interface is also used for controlling the device from an HMI device. The specified conditions also apply in this case regarding the browser and JAVA-VM.

The SIMATIC VS130-2
- offers a remote maintenance concept via a web-based user interface
- can be remote-controlled via integrated digital inputs, PROFIBUS or PROFINET IO
- is available as a complete package in several variants for different code sizes
- is available in 6 language versions (operator interface, manual and online help are available in German, English, French, Spanish, Italian, and Chinese).

Readable codes

1D codes (barcodes)
- Code 39,
- Code 128,
- Interleave 2/5,
- EAN13.

2D codes
- Data matrix code (DMC) according to ECC200,
- QR (alphanumeric characters; without sub-variants: truncated, macro, micro),
- PDF417 (without subvariants: macro, micro).

SIMATIC VS130-2

Complete package for object inspection;
comprising sensor head, LED incident light (ring lamp 6GF9 004-8BA), processing unit and the following cables:
• Cable between processing unit and sensor head, for lengths see below
• Cable between lighting and processing unit (except for reading system with variable field of view), for length see below
• Cable for power supply, length 10 m
• Cable for connecting digital I/O devices, length 10 m

Incl. documentation package for SIMATIC VS130-2.

• Field of view 70 mm x 50 mm
  - With cable length 2.5 m — **6GF1 130-1BA**
  - With cable length 10 m — **6GF1 130-1BA01**
• Field of view 40 mm x 30 mm
  - With cable length 2.5 m — **6GF1 130-2BA**
  - With cable length 10 m — **6GF1 130-2BA01**
• Field of view 20 mm x 15 mm
  - With cable length 2.5 m — **6GF1 130-4BA**
  - With cable length 10 m — **6GF1 130-4BA01**
• Variable field of view with 640 x 480 pixels and prepared for IP65 protective housing (note: Delivery without light and light cable).
  - With cable length 2.5 m — **6GF1 130-3BB**
  - With cable length 10 m — **6GF1 130-3BB01**
• Variable field of view with 1024 x 768 pixels and prepared for IP65 protective housing (note: Delivery without light and light cable).
  - With cable length 2.5 m — **6GF1 130-3BC**
  - With cable length 10 m — **6GF1 130-3BC01**

Lenses
See separate section "Lenses" on page 3/326

Protective barrel for lens
for external lighting,
internal diameter: 41 mm,
length from mount: 65 mm,
IP65 degree of protection.

Protective barrel for lens D50, glass — **6GF9 002-7AA**
Front pane: Glass

Protective barrel for lens D50, PMMA — **6GF9 002-7AA01**
Front pane: PMMA

LED ring lamps (plastic)
Dimensions H x W x D (mm)
102 x 102 x 26.5
IP65 degree of protection,
not suitable for protective barrel for lens D50.
Figure shows protective barrel for lens;
2 small mounting brackets enclosed

LED ring light, red, diffuse — **6GF9 004-8BA**
Operating range 75 mm to 0.5 m

LED ring light, red, clear — **6GF9 004-8CA**
Operating range 75 mm to 1000 mm

LED ring light, infrared, diffuse — **6GF9 004-7AA**
Operating range 75 mm to 0.5 m

LED ring lights (metal)
Dimensions W x H x D (mm)
116 x 116 x 42,
suitable for protective barrel for lens D50.

LED ring light, infrared, diffuse — **6GF9 004-7AA01**
Light source: 850 nm,
range of illumination:
75 mm to 250 mm,
degree of protection: IP65.

LED ring light, infrared, clear — **6GF9 004-7BA01**
Light source: 850 nm,
range of illumination:
500 mm to 3 000 mm,
degree of protection: IP65.

LED ring light, red, diffuse — **6GF9 004-8BA01**
Light source: 75 mm to 250 mm,
degree of protection: IP67.

LED ring light, red, clear — **6GF9 004-8CA01**
Light source:
150 mm to 2 000 mm,
degree of protection: IP67.

LED ring light, red, clear — **6GF9 004-8DA01**
Light source:
500 mm to 3 000 mm,
degree of protection: IP67.

Lamp multiplexer — **6GF9 002-7BA**
for connecting several ring lights to a VS130-2 evaluation unit

Overview

The SIMATIC VS120 has been specially developed for shape recognition in industrial environments. The Vision Sensor combines industry-standard, rugged recognition reliability and ease of operation with the safety of industry-standard communication – PROFIBUS and PROFINET. The Vision Sensor is perfectly integrated into the SIMATIC S7 automation environment using a standardized function block.

- Sensor for object finding and object shape testing in incident light
- VS120 finds and checks different objects and/or patterns, e.g.:
  - Printed symbols (product markings on labels, packaging, etc.)
  - Injection molded components
  - Ceramic elements
- Simple configuration by presenting the "good" object to be recognized. The "teach-in" is performed automatically when the training function of the device is activated.
- Parameters are assigned by means of a web-based user interface that is executable on different platforms to which the following requirements apply:
  - Browser (IE5.5 or higher)
  - JAVA-VM (MS, SUN)
- The web-based operator interface is also used for controlling the device from an HMI device. The requirements regarding the browser and JAVA VM also apply here.
- Remote maintenance concept using web-based operator interface.
- Can be remote controlled via integrated digital inputs, PROFIBUS, or PROFINET IO.
- Supplied as a complete package in several versions for different object sizes.

PROFIBUS
Vision sensors

Lenses

Overview

With a lens suitable for the respective image evaluation task, the size of the image field is determined for the camera image for the required operating distance.

High light intensity and the geometry of the image are extremely important for image evaluation (code reading, form recognition and position detection) High light intensity permits short shutter speeds and consequently a reduction of the blurring due to motion as well as maximizing the range.

Fault-free image geometry optimizes the fault tolerance of image analysis with regard to perspective and unevenness of the surface of the depicted object.

Lenses with fixed focal length and a settable aperture and focus are ideal for this purpose and are therefore preferred.

Ordering data

	Order No.
Lenses for reading code and plain text and parts recognition	
with fixed focal length, adjustable aperture and focus, with locking screw	
• **Mini lens 8.5 mm, 1:1.5** D = 42 mm, L = 47 mm; successor type for 6GF9001-1BE;	6GF9 001-1BE01

■ **Overview**

STEP 7 V11 (TIA Portal), portal view

Intuitive, efficient and future-oriented – the new engineering software for programming the S7 controllers

SIMATIC STEP 7 Professional V11 is the easy-to-use, integrated engineering system for the current SIMATIC S7-1200, S7-300, S7-400 controllers and WinAC.

SIMATIC STEP 7 Basic V11 is the successor to STEP 7 Basic V10.5 and supports the additional functions of the firmware 2.0 of the S7-1200 controller.

STEP 7 V11 is based on the new central engineering framework Totally Integrated Automation Portal (TIA Portal), which offers the user a uniform, efficient and intuitive solution to all automation tasks. TIA Portal forms the integrated working environment for IA and DT engineering software.

WinCC Basic for configuration of Basic Panels is included in the scope of supply.

• STEP 7 Basic	**6ES7 822-0AA00-0YL0**
Software Update Service (Compact Edition)	
The delivery items are combined. For several contracts, only 1 package with 1 data medium set, 1 USB flash drive with the corresponding number of licenses and the corresponding number of COLs will be supplied.	
The delivery items to be combined must be ordered as one item.	
• STEP 7 Professional V11	**6ES7 822-1AA00-0YM5**
• STEP 7 Professional and STEP 7 Professional in the TIA Portal	**6ES7 810-5CC00-0YM2**
• STEP 7 Basic	**6ES7 822-0AA00-0YM0**

Note:

You can find more information in Catalog ST 70 and in the Industry Mall at www.siemens.com/industrymall

3

Overview

- STEP 7 basic software:
  The standard tool for the SIMATIC S7, SIMATIC C7 and
  SIMATIC WinAC automation systems.
- Makes use of the full performance capabilities of the systems
- User-friendly functions for all phases of an automation project:
  - Configuring and parameterizing the hardware
  - Definition of communication
  - Programming
  - Testing, commissioning and service
  - Documentation, archiving
  - Operating, diagnostics functions

Ordering data	Order No.
STEP 7 Version 5.5	
Target system: SIMATIC S7-300/400, SIMATIC C7, SIMATIC WinAC *Requirements:* Windows XP Prof., Windows 7 Professional / Ultimate *Delivery package:* German, English, French, Spanish, Italian; incl. license key on USB stick, with electronic documentation	
Floating license on DVD	**6ES7 810-4CC10-0YA5**
Rental license for 50 hours	**6ES7 810-4CC10-0YA6**
Software Update Service on DVD (requires current software version)	**6ES7 810-4BC01-0YX2**
Upgrade Floating License 3.x/4.x/5.x to V5.5; on DVD	**6ES7 810-4CC10-0YE5**
Trial License STEP 7 V5.5; on DVD, 14 day trial	**6ES7 810-4CC10-0YA7**
STEP 7 Version 5.4 Japanese	
Target system: SIMATIC S7-300/400, SIMATIC C7, SIMATIC WinAC *Requirements:* Windows XP Professional Japanese *Delivery package:* English, Japanese; incl. authorization disk 3,5", without electronic documentation	
Floating License Japanese on DVD	**6ES7 810-4CC08-0JA5**
Upgrade Floating License Japanese 3.x/4.x/5.x to V5.4; on DVD	**6ES7 810-4CC08-0JE5**
STEP 7 Version 5.5, Chinese	
Target system: SIMATIC S7-300/400, SIMATIC C7, SIMATIC WinAC *Requirements:* Windows XP Professional Chinese *Delivery package:* English, Chinese; incl. license key on USB stick, with electronic documentation	
Floating License Chinese on DVD	**6ES7 810-4CC10-0KA5**
Upgrade Floating License Chinese 3.x/4.x/5.x to V5.5; on DVD	**6ES7 810-4CC10-0KE5**

■ Overview

Configuration options with SIMATIC PDM

SIMATIC PDM (Process Device Manager) is a universal, vendor-independent tool for the configuration, parameterization, commissioning, diagnostics and servicing of intelligent field devices (sensors and actuators) and field components (remote I/Os, multiplexers, control-room devices, compact controllers), which in the following sections will be referred to simply as devices.

Using *one* software, SIMATIC PDM enables the processing of more than 2000 devices from Siemens and over 200 vendors worldwide on *one* homogeneous user interface.

The user interface satisfies the requirements of the VDI/VDE GMA 2187 and IEC 65/349/CD directives. Parameters and functions for all supported devices are displayed in a consistent and uniform fashion independent of their communications interface. Even complex devices with several hundred parameters can be represented clearly and processed quickly. Using SIMATIC PDM it is very easy to navigate in highly complex stations such as remote I/Os and even connected field devices.

From the viewpoint of device integration, SIMATIC PDM is the most powerful open device manager available in the world. Devices which previously were not supported can be easily integrated in SIMATIC PDM at any time by importing their device descriptions (EDD). This provides security for your investment and saves you investment costs, training expenses and follow-up costs.

SIMATIC PDM supports the operative system management in particular through:

- Uniform presentation and operation of devices
- Indicators for preventive maintenance and servicing
- Detection of changes in the project and device
- Increasing the operational reliability
- Reducing the investment, operating and maintenance costs
- Graded user privileges including password protection

When used in SIMATIC PCS 7, SIMATIC PDM is integrated in the asset management of the process control system. You can change directly to the SIMATIC PDM views from the diagnostics faceplates in the Maintenance Station.

The Process Device Manager provides more detailed information for all devices described by means of an Electronic Device Description (EDD), e.g.:

- Detailed diagnostics information (manufacturer information, information on error diagnostics and troubleshooting, further documentation)
- Information on changes (audit trail report)
- Parameter information

SIMATIC PDM Process Device Manager

■ **Ordering data**

SIMATIC PDM belongs to the SIMATIC products which can be used both in the context of SIMATIC PCS 7 and in the extended context of Totally Integrated Automation (TIA). The product packages offered for different fields of application differ with regard to functionality, ordering data, and type of delivery. To provide a better overview and to avoid faulty ordering, the selection and ordering data for SIMATIC PCS 7 are listed separately.

Ordering data for SIMATIC PCS 7 applications

SIMATIC PDM V6.0

	Order No.
Product packages	
SIMATIC PDM PCS 7 V6.0 Complete package for integration into the engineering toolset of the SIMATIC PCS 7 engineering system 6 languages (German, English, French, Italian, Spanish, Chinese), software class A, executes with Windows XP Professional Floating license for 1 user, with • SIMATIC PDM Basic • Integration in STEP 7 / PCS 7 • Routing via S7-400 • 128 TAGs Type of delivery: License key disk, certificate of license including terms and conditions; software SIMATIC PDM V6.0 and device library on CD/DVD	**6ES7 658-3LX06-0YA5**
Optional product components for SIMATIC PDM V6.0	
SIMATIC PDM communication via standard HART multiplexer 6 languages (German, English, French, Italian, Spanish, Chinese), software class A, executes with Windows 2000 Professional or Windows XP Professional, floating license for 1 user Type of delivery: License key disk, certificate of license including terms and conditions	**6ES7 658-3EX06-2YB5**

	Order No.
PowerPacks for SIMATIC PDM V6.0	
SIMATIC PDM PowerPack for expanding the TAGs of SIMATIC PDM PCS 7 V6.0 6 languages (German, English, French, Italian, Spanish, Chinese), software class A, executes with Windows XP Professional Floating license for 1 user Type of delivery: License key disk, certificate of license including terms and conditions	
• From 128 TAGs to 512 TAGs	**6ES7 658-3XB06-2YD5**
• From 512 TAGs to 1 024 TAGs	**6ES7 658-3XC06-2YD5**

SIMATIC PDM V7.0

Product packages

SIMATIC PDM PCS 7 V7.0
Complete package for integration into the engineering toolset of the SIMATIC PCS 7 engineering system

5 languages (German, English, French, Italian, Spanish), software class A, executes with Windows XP Professional and Server 2003

Floating license for 1 user, with
• SIMATIC PDM Basic and Extended
• Integration in STEP 7 / PCS 7
• Routing via S7-400
• 100 TAGs

Note:
SIMATIC PDM PCS 7 V7.0 requires the installation of SIMATIC PCS 7 V7.1+SP2 or higher!

Type of delivery:
License key memory stick, certificate of license including terms and conditions; software SIMATIC PDM V7.0 and device library on CD/DVD

6ES7 658-3LD07-0YA5

SIMATIC PDM PCS 7-FF V7.0
Complete package for integration into the engineering toolset of the SIMATIC PCS 7 engineering system

5 languages (German, English, French, Italian, Spanish), software class A, executes with Windows XP Professional and Server 2003

Floating license for 1 user, with
• SIMATIC PDM Basic and Extended
• Integration in STEP 7 / PCS 7
• Routing via S7-400
• Communication FOUNDATION Fieldbus
• 100 TAGs

Note:
SIMATIC PDM PCS 7-FF V7.0 requires the installation of SIMATIC PCS 7 V7.1+SP2 or higher!

Type of delivery:
License key memory stick, certificate of license including terms and conditions; software SIMATIC PDM V7.0 and device library on CD/DVD

6ES7 658-3MD07-0YA5

Optional product components for SIMATIC PDM V7.0

SIMATIC PDM Communication FOUNDATION Fieldbus V7.0
5 languages (German, English, French, Italian, Spanish), software class A, executes with Windows XP Professional and Server 2003, floating license for 1 user

Type of delivery:
License key memory stick, certificate of license including terms and conditions

6ES7658-3QX07-2YB5

SIMATIC PDM TAGs for SIMATIC PDM V7.0

SIMATIC PDM TAGs
Count Relevant Licenses (can be accumulated) for expanding the TAGs of SIMATIC PDM product packages V7.0 or higher

Type of delivery:
SIMATIC PDM V6.0 software and
device library on CD/DVD

More information

Update/Upgrade

All SIMATIC PDM product variants and combinations with
Version 5.x can be upgraded to Version 6.0 per SIMATIC PDM
Upgrade.

Product configurations according to SIMATIC PDM PCS 7 V6.0
that are used in the SIMATIC PCS 7 process control system
can be upgraded to V7.0 by means of an upgrade package.
SIMATIC PCS 7 V7.1 + SP2 or higher must be installed, however,
to permit the installation of the upgrade package for upgrading
from SIMATIC PDM V6.0 to V7.0.

A Software Update Service in the form of a subscription is also
offered for SIMATIC PDM.

For further information, see Sections "Updates/upgrades
asynchronous to the PCS 7 version" and "Software Update
Service" in Chapter "Update/upgrade packages" in
Catalog SIMATIC PCS 7.

3

PROFIBUS
Engineering/Network Management/Diagnostics

BANYnet bus analysis and diagnostics

Overview

BANYnet is a tool based on Microsoft Windows for documentation, monitoring, diagnostics, recording and analysis of Ethernet and PROFIBUS networks.

- Management of all IP and MAC addresses in the network
- Generation of a network overview map
- Automatic scanning of network
- Monitoring of network nodes for "Failure", "Newly added", "Not registered"
- Reading out of data, message frame types and error statistics from the network components
- Display of bus load
- Recording of message frame traffic
- Recording of PROFINET communication
- Recording of PROFIBUS communication
- Comprehensive trigger, filter and sorting functions

BANYnet plant configuration

Benefits

- Continuously updated overview of the configured network (number/type of components)
- Permanent bus load display ensures sufficient performance in the network
- Fast localization of errors in network components
- Network optimization through statistics on type and length of message frame, cycle time, etc.

Application

The functionality for this is distributed as follows between five independent program modules:

- The Plant Manager of BANYnet Ethernet offers valuable support toward configuration of your plant through management of IP and MAC addresses, automatic generation of the plant display, and import and export functions.
- The Observer scans the network using various protocols, and displays safety-related changes in the network topology both in an overview and in a hierarchy.
- The Plant Diagnostics reads the configuration data as well as comprehensive message frame type and error statistics from the SNMP-capable network components, and provides information to assist searching for errors in the Ethernet network. Data such as bus load or lifelist are evaluated and displayed online.
- The Bus Analysis records the message frame traffic on one or more Ethernet buses synchronously, and interprets the message frames throughout all levels, including SIMATIC S7/PCS 7 and PROFINET. Comprehensive trigger, filter and sorting functions allow fast localization of errors.
- The Profibus Scope records the message frame traffic of a PROFIBUS network using a CP 5512, and interprets the message frames accordingly. Comprehensive trigger, filter and sorting functions allow fast localization of errors.

Function

The **Plant Manager** is used to configure the database of the BANYnet project. All information required is created in data structures. An import/export function allows data exchange with other programs. A user-friendly plant overview is automatically generated from the data structures. The Plant Manager can therefore be used for both documentation and configuration of Ethernet networks. Tables provide detailed information on the properties of the nodes. Furthermore, any type of information can be assigned to the individual nodes for documentation purposes.

The **Plant Diagnostics** scans the system data of SNMP-capable network nodes (e.g. switches, PCs), and thus provides information on the configured nodes. The bus load display of the individual ports (numeric or graphic) and the list of nodes provide great assistance in locating errors in the Ethernet network.

Statistics functions provide information on the number of individual message frame types (packet lengths, message frame types, error types, etc.). The events (traps) sent by the switch can be displayed in a list.

Parameterization of the SCALANCE X and OSM/ESM Industrial Ethernet switches is supported in addition, e.g. IP address, port configuration or firmware update.

Function (continued)

The **Bus Analysis** allows user-friendly analysis of recorded files (import/export of Netmon or Sniffer files is also possible) over several interfaces simultaneously (e.g. for redundancy analyses) by means of the integral BANYmon. Errors can be rapidly located using predefined or user-generated filter and sorting functions. When one of the listed message frames is clicked, the associated detailed information is output. SIMATIC S5/S7/PCS 7-specific message frames are interpreted and displayed according to their type (e.g. redundant message frames, alarm-8 message frames, etc.).

When using a CP 1616, PROFINET data traffic can be recorded without time losses and with complete message frame interpretation.

The **Observer** permits user-friendly and reliable dynamic monitoring of your network. The actual state is compared with the project created in the Plant Manager, and changes are displayed immediately. In order to locate events such as errors or the penetration of unknown nodes, it is possible to graphically trace the network hierarchy back to the source. In addition, these events are saved in log files for later analysis and documentation.

Furthermore, the scanned data can be imported into the project and updated supplementary to the Plant Manager.

The **PROFIBUS Scope** permits recording, saving and user-friendly analysis of bus events. It supports all baud rates from 9.6 kbit/s to 12 Mbit/s, and determines these automatically. The recording can be carried out in a linear buffer or a cyclic buffer of selectable size. Long-term recording is possible in this manner. The start and end of recording can be automated using triggers. The data quantities can be reduced during the recording using predefined or user-created filter and sorting functions, and errors can be easily located by means of the subsequent analysis. When a listed message frame is clicked, its detailed information is output. The SIMATIC S7/PCS 7-specific message frames are interpreted and displayed depending on their type (e.g. redundant message frames, alarm-8 message frames, etc.). The following protocols are interpreted: DP, FDL, DPV1, DPV2, FMS and S7.

The BANYnet function for executing several recordings in parallel can be used for the **redundancy analysis**. BANYnet PROFIBUS is connected to the redundant bus segments for this purpose. Since the recorded message frames are assigned synchronous time stamps, the communication flow information can be easily compared. This allows fast and exact locating of redundancy problems.

Note:

The computer with the BANYnet PROFIBUS program package requires a CP 5512 (PC card) for the PROFIBUS connection.

Ordering data

	Order No.
BANYnet bus analysis and diagnostics	
Program package for PC/PG for Microsoft Windows NT/2000/XP SP2 and electronic documentation on CD, dual language (German, English), software protected by USB dongle

PROFIBUS
PROFIBUS components

PROFIBUS DP ASICs

Overview

- Easy connection of field devices to PROFIBUS
- Integrated low power management
- Different ASICs for the different functional requirements and application areas

Application

The PROFIBUS DP ASICs allow equipment manufacturers to connect their devices to PROFIBUS easily.

They can be implemented at transmission rates of up to 12 Mbit/s.

The following blocks are available for different functional requirements and fields of application:

- Master applications:
  ASPC 2
- Intelligent slaves:
  SPC 3 and SPC3LV for PROFIBUS DP, with hardware-controlled bus access;
  DPC 31 with integral 8031 core;
  SPC 4-2.
- Connection in intrinsically safe systems:
  SIM 1-2 for physical connection in intrinsically safe fieldbus systems as a Medium Attachment Unit for IEC 61158-2 at 31.25 kbit/s. Especially for combining with the SPC 4-2 and DPC 31.
- Simple slaves:
  LSPM 2 with 32 input/output bits for confined spaces
- Connection to fiber-optic conductors:
  FOCSI
  module for electrical conditioning of signals already received or to be sent. The module ensures that the optically transmitted signals are properly electrically restored (retiming/retriggering)

For initial development, order quantities of 5/6 ASICs are possible (not suitable for batch assembly because the pins of the ASIC can be bent due to the packaging; packing units larger than 5/6 units must be used)

The number of ASICs per packing unit depends on the ASIC type (see ordering data).

The ASICS ASPC 2, SPC3, SPC3LV, DPC31, LSPM2 and FOCSI can also be supplied in a lead-free design.

Design

ASPC 2

The ASPC 2 is a preprocessing communications chip for master applications with a maximum transmission rate of 12 Mbit/s. The ASIC has not been disclosed. The brief user manual describes the pins and the electrical properties of the ASPC 2. A separate microprocessor and the appropriate firmware are required for operation. The firmware is tuned to the 80C165 processor and can be obtained by purchasing a license.

SPC 3

The SPC 3 is a preprocessing communications chip with a processor interface. The SPC 3 processes message frame identification, address identification, execution of the data back-up sequences and protocol processing for PROFIBUS DP.

Firmware is offered for the Siemens SPC 3 (see ordering data).

SPC 3LV

The product portfolio for intelligent PROFIBUS slave applications was expanded by a 3.3 V version. The SPC3LV is 100% compatible in terms of functions and pins to the 5 V version (SPC3).

DPC 31

The DPC 31 is a preprocessing communications module with a processor interface and an integrated processor core (C31 core).

It supports the connection of intelligent field devices as slaves on PROFIBUS DP and PROFIBUS PA.

The DPC 31 autonomously processes all communications tasks and has, in addition, an integral C31 core for further applications. It combines the communication properties of the ASICs SPC 3 and SPC 4-2 in one chip. The integrated C31 core can also be programmed as required. Firmware is offered for the Siemens ASIC DPC 31 (see ordering data).

SPC 4-2

The SPC 4-2 is a preprocessing communications chip with a processor interface. It is designed for combined applications and due to the Low Power Management function, it is ideally suited to use in intrinsically safe applications. Firmware is offered for the SPC 4-2 by the company TMG itec [1]. The signals are converted for PROFIBUS PA using the SIM 1-2 module.

Design (continued)

SIM 1-2

The SIM 1-2 supplements the SPC 4-2 or DPC 31. Only a few external components are required in addition to these ASICs to be able to connect field devices to an intrinsically safe network in accordance with PROFIBUS PA. In combination with the SPC 4-2 or DPC 31, the functions of a PROFIBUS PA slave can be processed from physical linking through to communication control.

SIM 1-2 supports all send and receive functions (including Jabber Control) as well as the high-resistance decoupling of auxiliary power from the bus cable. It provides an adjustable, stabilized supply voltage and also supports configuration of an electrically isolating power supply with just a few passive components.

The ASIC contains a special interface logic which provides a low-overhead, minimum power interface for galvanic signal separation as an alternative to the standard signal interface.

It can be connected to all Manchester encoders/decoders to the IEC 61 158-2 standard at 31.25 kbit/s.

LSPM 2

LSPM 2 is a single-chip solution with 32 input/output bits. It processes all bus communication autonomously. An additional microprocessor and firmware are not required. The compact MQFP casing with 80 pins makes it ideal for applications with low space requirements.

FOCSI

This ASIC functions as an expansion to the existing PROFIBUS ASICs. The FOCSI module (Fiber Optic Controller from Siemens) ensures proper electrical conditioning and transfer of the received/sent optical signal. To inject the signal into a fiber-optic conductor, apart from FOCSI, the appropriate optical transmitter and receiver will be required. FOCSI can be used with the PROFIBUS DP ASICs described above.

Overview

- PC slave board IM 182-1 for the connection of AT-compatible PCs as DP slaves

Application

The PROFIBUS DP interface module IM 182-2 makes it easy to connect a slave to PROFIBUS DP. It is based on the ASIC SPC3 of Siemens AG. The interface module can be implemented up to a transmission rate of 12 Mbit/s.

Design

IM 182-1 PC slave board

The simple IM 182-1 PC slave card (ISA bus) is based on the ASIC SPC 3. It contains all the physical bus components. A 9-pin Sub-D connector is used for connecting to PROFIBUS DP.

The firmware of the SPC 3 can be used as an accessory on the PC. The 1.5 KB RAM of the SPC 3 forms the interface to the host system. A driver for Windows NT is also offered.

PROFIBUS
PROFIBUS components

Development kits

■ Overview

Development kit

Using the development kits, PROFIBUS hardware and software applications can be developed and tested using the PROFIBUS ASICs DPC31.

The comprehensive, perfectly interacting hardware and software components considerably reduce the development costs for a PROFIBUS device.

The kits provide a fully functional hardware development environment which development engineers can build on with their special requirements for hardware and software. The kit documentation is supplied on CD in English and German.

The kits make our PROFIBUS know-how accessible to other users. The development team is available to provide advice to new users even with their own developments - this consultancy service is also a component part of the development kit.

Following completion of a development, devices can be certified by our experts in the PROFIBUS interface centers – we can help new users here, too.

PROFIBUS DP/PA development kit

The kit facilitates set up of PROFIBUS slaves with a variety of PROFIBUS standards:

- PROFIBUS DP-V1 (RS485)
- PROFIBUS PA (IEC 1158) and
- PROFIBUS based on fiber-optic cables.

The development environment shows applications implemented using PROFIBUS-ASICs DPC 31.

Hardware included:

- DPC 31 development board; for developing/testing proprietary applications
- CP 5613; serves as master interface for the PC (PCI card)
- Optical bus terminal; for conversion of copper cables to FOCs
- Pre-assembled PROFIBUS cables

Software included:

- Testing and simulation software under WinNT for use on the PC in connection with the CP 5613 master module
- Sample program for the DPC 31 board
- DPC 31 DPV1 original firmware, including developer license
- Parameterization software for CP 5613 "COM PROFIBUS" for DP operation

When developing PROFIBUS PA applications, order a PROFIBUS DP/PA coupler (6ES7 157-0AC80-0XA0) separately. The DP/PA coupler converts the PROFIBUS DP physical specifications into those of PROFIBUS PA. This module is not included in the development kit!

PROFIsafe starter kit V3.4

The PROFIsafe starter kit V3.4 is compatible with version 2.4 of the PROFIsafe profile, as specified in IEC 61784-3-3. It meets a series of user requirements such as multi-instance capability and variable process data length at runtime.

Along with all of the PI specifications required for development, the PROFIsafe starter kit contains the source files for the PROFIsafe driver software (PSD) and a comprehensive implementation manual in English and German. In addition, it includes various CRC calculation tools and tools for creating GSD files with security-related parameters.

Examples of adaptation of the PSD (PROFIsafe Driver) to current PROFIBUS and PROFINET stack interfaces provide assistance for adaptations that may be necessary. Special "slow motion monitors" allow the PROFIsafe protocol processes to be monitored in slow motion. A new feature is support for the iPar server and the TCI interface.

Example applications are provided on the CD-ROM for both PROFIBUS and PROFINET. The hardware components supplied in the development kits offer the user access to the PROFIsafe world, step-by-step.

The PROFIsafe starter kit consists of the following components:

- Current PROFIsafe specifications with current PROFIsafe certificate
- PROFIsafe driver software (as core component of the development package)
- Example GSD file for STEP7 (for PROFIBUS DP/PA development package and DK-ERTEC 200 PN IO)
- Example project for S7-319F (for PROFIBUS DP/PA development package and DK-ERTEC 200 PN IO)
- GSD tools (e.g. GSD editor and CRC calculation tool)
- iPar server software and instructions (FB24)
- Tool calling interface example and instructions
- F programming guidelines
- Layer stacks (V1SL and PN IO)
- Example firmware (for PROFIBUS DP/PA development package and DK-ERTEC 200 PN IO)
- Project for development environment example (for PROFIBUS DP/PA development package and DK-ERTEC 200 PN IO)
- Slow motion monitor (for PROFIBUS: PG-PC and CP5613, for PROFINET: PG-CP1616)
- Comprehensive documentation

PROFIBUS
Partner solutions

Delphi-S7, Delphi-DPLib and Delphi-DPSoftnetSlave

3

Overview

The Delphi software products offer programming interfaces for Delphi developments with access to PROFIBUS.

The following protocols are available:

- PROFIBUS DP (Delphi-DPLib)
  for the DP-5613 software with CP 5613 A2/CP 5614 A2 or SOFTNET-DP with CP 5512, CP 5611 A2 or CP 5621

- PROFIBUS DP SOFTNET slave (Delphi-DPSoftnetSlave)
  for all SIMATIC DP slave products for CP 5611 A2 or CP 5621

- S7 communication (Delphi-S7)
  for the S7-5613 software with CP 5613 A2/CP 5614 A2 or SOFTNET-S7 with CP 5512/CP 5611 A2 or CP 5621

The products enable easy access to the Siemens SIMATIC NET programming interfaces under Borland Delphi.

In its communication functions, the interface for Borland Delphi is analogous to the Siemens interface for the programming language C. All the services of the relevant communication protocols over PROFIBUS are supported.

Benefits

g **e** **t** **get** Designed for Industry

- Interfacing the Borland world to SIMATIC NET
- Developments are executable on computers with PCI, PCI Express, PCMCIA or PC card slots

SIMATIC ET 200
Distributed I/O

4

SIMATIC ET 200 Distributed I/O

Introduction

Overview

SIMATIC ET 200 –
offers the right solution for every application

SIMATIC ET 200 provides extremely wide range of distributed I/O systems – for solutions in the control cabinet or directly on the machine without a control cabinet and for use in areas where there is an explosion hazard. The modular design means that it is easy to scale and expand the ET 200 systems in small increments. Ready-installed add-on modules reduce the costs, whilst at the same time offering wide-ranging application options. An extremely wide range of combinations is possible: digital and anlog inputs/outputs, intelligent modules with CPU functionality, safety systems, motor starters, pneumatics, frequency converters and various technology modules
(e.g. for counting and positioning tasks).

Communication via PROFIBUS and PROFINET, uniform engineering, transparent diagnosis possibilities and the optimal connection to SIMATIC Controller and HMI devices provide evidence of the unique uniformity of Totally Integrated Automation.

PROFIBUS

PROFIBUS is the international standard (IEC 61158/61784) for the field area. As the only field bus it permits communication in both manufacturing- and process-related applications.

PROFIBUS is used to connect field devices such as distributed I/O stations or operating mechanisms to automation systems such as SIMATIC S7, SIMOTION, SINUMERIK or PCs.

PROFIBUS, which is standardized according to IEC 61158, is a powerful, open and robust field bus system with short response times. PROFIBUS is available in different physical forms for various applications.

PROFIBUS DP (distributed I/O)

Is used for the connection of distributed field devices, e.g. SIMATIC ET 200, or drives with very rapid response times. PROFIBUS DP is used when actuators/sensors are distributed on the machine or in the system (e.g. field level).

PROFINET

PROFINET is the open and cross-vendor Industrial Ethernet Standard (IEC 61158/61784) for automation.

Based upon Industrial Ethernet, PROFINET enables the direct communication of field devices (IO devices) with controllers (IO controllers) right through to the solution of clocked drive controls for Motion Control applications.

Since PROFINET is based upon Standard Ethernet according to IEEE 802.3, devices from the field level to the control level can be universally connected.

PROFINET thus leads to a universal communication, enables system-wide engineering and uses IT standards such as web server or FTP right through to the field level. Proven fieldbus systems, such as PROFIBUS or AS-Interface, are simple to integrate without changes to the existing devices.

AS-Interface

AS-Interface is the international standard (IEC 62026/EN 50295) providing an alternative to the cable harness to connect particularly economical sensors and actuators in the field area via a single 2-wire cable. The power supply to the individual stations also runs via this 2-wire cable. This means that AS-Interface is the ideal partner for the PROFIBUS DP field bus.

SIMATIC ET 200 Configurator

A tailor-made peripheral station in the click of a mouse:
with the SIMATIC ET 200 Configurator

With the ET 200 Configurator first-class support is available even for the configuration of the ET 200 station. The software tool leads you through the configuration in a user-friendly, simple and convenient manner and automatically creates order lists inc. accessories. It also provides support for the adherence to limit values such as load currents, slot rules or parameters.

The configuration created in the ET 200 Configurator can easily be imported into STEP 7. This reduces the engineering cost and saves data having to be entered twice.

The software tool is clearly and transparently structured: six configuration views make the work simple and user friendly.

- General: general station data and a graphic depiction of the configured station
- Module selection: guided selection of the modules by module suggestions
- Limits: display of station sizes, weight, number of modules, load voltage, parameters, etc.
- Accessories: guided selection of the required accessories (module specific or station wide)
- Potential distribution: graphical representation of the potentials within a station
- Parts list: automatic generation of a clear parts list simplifies the ordering process

The ET 200 Configurator is part of the SIMATIC Selection Tools and is available as a configurator in the Industry Mall.

SIMATIC ET 200 Distributed I/O
Systems for the control cabinet

■ **Overview**

SIMATIC ET 200S

- Distributed I/O system with IP20 degree of protection and low wiring outlay even for time-critical tasks such as rapid adjustments
- With integral S7 CPU can be used as small control system:
  - also as failsafe PROFIsafe version
  - optionally with lower-level PROFIBUS DP
- Fine modular structure for precise matching to the automation task
- Interface module with PROFIBUS DP or PROFINET interface available
- Can be combined with digital and analog input or output modules, technology modules, motor starters and frequency converters for the control of drives up to 7.5 or 4 kW
- Exchange of modules during operation (hot swapping), permanent wiring with multiple conductor connection
- Channel-specific diagnosis for high availability
- Optionally with integral FO interface
- Transmission rate up to 12 Mbit/s
- FastConnect thanks to stripless quick-connect technology, screw- or spring-type terminals
- Ex approval according to Cat. 3 for Zone 2 according to ATEX 100 a
- Slot reservation with reserve modules
- Failsafe DI module with safety-oriented signal processing according to PROFIsafe
- Options handling – for extremely simple management of machine options

SIMATIC ET 200S COMPACT

- Block I/Os in IP20 degree of protection with 32 channels made up of terminal block and electronics block
- Expandable on a finely modular basis to up to 128 channels or max. 12 modules
- Entire ET 200S module spectrum usable (except PROFIsafe module)
- Separation of connection technology and electronics using permanent wiring
- Screw- and spring-type connection technology
- Standard terminal block in 2-wire technology; 3- and 4-wire technology via additional terminals
- Mounting on standard mounting rails
- Hot swapping for the expansion modules
- Communication with PROFIBUS
- Up to 100 bytes inputs and outputs (address area)

SIMATIC ET 200 Distributed I/O
Systems for the control cabinet

ET 200S
Motor Starters and Safety Motor Starters

■ **General data**

ET 200S motor starters in the ET 200S I/O system

The SIMATIC ET 200S is the multifunctional and finely modular I/O system in degree of protection IP20 for exact adaptation to the automation task.

Interface modules (IM) are used for connecting the ET 200S to PROFIBUS DP or PROFINET. If interface modules with integrated S7-CPU are used, the ET 200S can act as a small control system.

The ET 200S is designed for combining with a large range of digital and analog input or output modules, technology modules, IO-Link master modules, pneumatic connections, or motor starters and frequency converters for the control of drives.

Device replacement is easy and quick thanks to permanent wiring and automatic re-parameterization. Hot swapping, i. e. the disconnection and connection of modules without prior isolation, guarantees high availability of the automation system along with extensive diagnostics information.

The ET 200S motor starters are connected to the control system and parameterized through the field bus using either PROFIBUS or PROFINET via IM modules which are also available with CPU functionality.

With the ET 200S motor starters, any AC loads can be protected and switched. The communication interface makes them ideal for operation in distributed control cabinets or control enclosures.

Interplay of ET 200S motor starter components in the ET 200S I/O system

Motor starter types

The ET 200S motor starters are available as direct-on-line, reversing (reversing) or soft starter versions:

- **Standard motor starters** up to 5.5 kW
  (direct-on-line and reversing starters)
- **High-Feature motor starters** up to 7.5 kW
  (direct-on-line, reversing and direct-on-line soft starters)

- **Failsafe motor starters** up to 7.5 kW
  (direct-on-line and reversing starters)
  - Properties of the High Feature motor starter
  - Failsafe functionality

General data (continued)

Innovation of the ET 200S High-Feature motor starters

The ET 200S High-Feature motor starters have undergone radical innovation and now support the acyclic services on PROFIBUS and PROFINET as well as PROFIenergy on PROFINET.

They are now:
- Even more flexible – flexible assignment of parameters
- Even better integrated in TIA (Totally Integrated Automation)
- Even more transparent – through comprehensive diagnostic data records
- Even more anticipatory – through maintenance functions
- Energy-efficient – through PROFIenergy

Basic functionality of the ET 200S motor starters

All versions of the ET 200S motor starters have the following functionality. The further specific functionality is described for the respective versions.

- Fully pre-wired motor starters for switching and protecting any AC loads up to 7.5 kW at 400 V AC and 500 V AC
- With self-assembling 40/50 A power bus, i.e. the load voltage is only supplied once for a group of motor starters
- All control supply voltages connected only once, i.e. when modules are added they are automatically connected to the next module
- Hot swapping is permissible
- Inputs and outputs for activating and signaling the status have been integrated
- Control of the motor starter from the control system and extensive diagnostics status via the cyclic process image
- Diagnostics capability for active monitoring of the switching and protection functions
- The signal states in the process image of the motor starter provide information about protective devices (short circuit or overload), the switching states of contactor(s) or soft starters, and system faults.
- Interface for controlling an expansion module, e.g. brake control module xB1...xB4 for controlling mechanical brakes in three-phase motors for 24 V DC and 500 V DC.
- Brake control module xB5 and xB6 for 400 V AC
- Can be combined with safety technology for use in safety-related system components (IEC 62 061 and ISO 13 849-1).

Mounting

As the motor starters are fully pre-wired, up to 80% of the wiring outlay can be saved. The control cabinets can be assembled far more quickly and compactly.

Expansions are easily possible through the subsequent adding of terminal modules. With their modular terminal design (10 mm²) the latter also do away with the distribution wiring otherwise required. Through the permanent wiring and the hot swapping function (disconnection and connection during operation) a motor starter can be replaced within seconds if necessary. The motor starters are therefore recommendable in particular for applications with special demands on availability.

Parameterization and configuration

Configuration is made easier by the fine modular structure.

When using the ET 200S motor starters, the list of parts per load feeder is reduced to two main items: The passive terminal module and the motor starter. This makes the ET 200S ideal for modular machine concepts as well.

All ET 200S motor starters are set up without fuses. Contactors and soft starters are activated through the integrated outputs. The inputs of the motor starters evaluate the signal states of the protective devices (short circuit or overload), the switching states of contactor(s) or soft starters, and system faults.

The motor starter protector signaling is freely programmable with regard to group fault signals (group fault at motor starter protector "Off"/group fault signal at motor starter protector "Off" only in case of "On" command from the motor starter).

Brake control modules and optional digital inputs and outputs

With one of the optional brake control modules (xB1-xB6), which is butt-mounted to the right of a motor starter, it is possible to control a mechanical holding brake on a three-phase motor from the process image of the motor starter.

Motors with 24 V DC brakes (xB1, xB3) as well as motors with 500 V DC brakes (xB2, xB4) can be controlled using the brake control modules xB1-xB4.

The modules xB5 (without digital input) and xB6 (with two digital inputs) have been added to the range in order to control a mechanical holding brake with a rated operational voltage of 400 V AC. A further motor brake voltage commonly found on the market is thus supported.

The 24 V DC brakes have an external supply and can be vented independently of the switching state of the motor starter. By contrast the 500 V DC brakes and the 400 V AC brakes usually have a direct supply from the terminal board of the motor through a rectifier module and therefore cannot be vented when the motor starter is switched off. These brakes cannot be used in combination with the DSS1e-x motor starter (soft starter).

The outputs of the brake control modules can be used alternatively for other purposes, e.g. for controlling DC valves.

With two digital inputs available on the brake control modules (xB3, xB4, xB6) and another two digital inputs available on the optional control module it is possible to realize autonomous special functions which work independently of the bus and the higher-level control system, e.g. as a quick stop on gate valve controls. The signals of these digital inputs are in the process image and are reported to the control system.

Power supply through terminal module

Power is supplied through the terminal modules for motor starters:

- The auxiliary voltages are fed in only once via the PM-D or PM-DFx power module which must be connected to the left of the first motor starter.
- The load voltage is fed in at the first (left) TM-xxxxS32 terminal module of a motor starter. The other TM-xxxxS31 terminal modules are automatically supplied with power through the integrated power bus when they are mounted side by side. If the power bus is utilized to its full capacity of 40 A for Standard motor starters or 50 A for High-Feature motor starters, a new supply must be fed in through an additional TM-xxxxS32 terminal module.

4

SIMATIC ET 200 Distributed I/O
Systems for the control cabinet

ET 200S
Motor Starters and Safety Motor Starters

■ **General data** (continued)

TM-DS and TM-RS terminal modules for motor starters

- Mechanical modules in which the motor starter and expansion modules are inserted
- For constructing the permanent wiring and self-assembling voltage bus
- For connecting the motor connection cables
- Positive-locking connection to ensure enhanced vibration resistance

Terminal modules are purely mechanical components for accommodating the ET 200S peripherals. The self-assembling voltage buses integrated into the terminal modules reduce wiring outlay to the single infeed (both of auxiliary and load voltage). All modules following on the right are automatically supplied upon plugging the terminal modules together. The robust design and keyed connection technology enables use in harsh industrial conditions.

The TM-DS and TM-RS terminal modules are available in various versions for the Standard motor starters and the High-Feature motor starters.

Terminal modules with the suffix "-S32"

- The terminal modules with the suffix "-S32" have connection terminals for feeding into the integrated 40 A/50 A power bus and connection terminals for the motor connection cable. They are mounted at the beginning (left) of a power bus segment.
- To configure a new load group, another "-S32" terminal module is plugged in.
- The "-S32" terminal modules are supplied with three caps for closing the power bus contacts on the final terminal module of a segment.
- Optionally expandable with PE/N blocks

Terminal modules with the suffix "-S31"

- The terminal modules with the suffix "-S31" have only connection terminals for the motor connection cable. These terminal modules follow on the right after a "-S32" terminal module.
- Optionally expandable with PE/N blocks

All connection terminals of the terminal modules for motor starters are equipped with strong 10 mm² screw terminals.

Power module (see Catalog ST 70, page 9/152)

PM-D power modules are used for monitoring the two 24 V DC auxiliary voltages for the group of motor starters following on the right or for supplying power to the group of frequency converters following on the right.

Terminal module TM-P for power module PM-D
(see Catalog ST 70, page 9/153)

- Connection by means of screw terminals
- Light colored enclosure for visual distinction
- Always before the first TM-DS/TM-RS

ET 200S Safety motor starters with integrated safety technology

The safety-related, communication-capable ET 200S motor starters offer the right solution for every safety application. The range extends from the simple local safety solution through to the user-friendly version with PROFIsafe, which can be used in conjunction with a safe control system (see "Safety modules local and PROFIsafe", page 4/11).

The safety engineering is an integral part and is therefore pre-wired at the factory.

The ET 200S Safety motor starters Solutions comprise:
- Safety modules (page 4/11)
- Standard motor starters (page 4/7)
- High-Feature motor starters (page 4/7)
- Failsafe motor starters (page 4/9)

System configuration with ET 200S motor starters

When constructing an ET 200S station with motor starters a distinction can be made between the following configurations:

- Conventional ET 200S motor starter solution consisting of:
  - PM-D module
  - Standard motor starter or High-Feature motor starter
- Safety motor starter ET 200S Solution local (see page 4/10)
- Safety motor starter ET 200S Solutions PROFIsafe (see page 4/14)

SIRIUS Motor Starter Function Block Library for SIMATIC PCS 7

With the SIRIUS motor starter PCS 7 function block library, SIRIUS ET 200S motor starters (direct-on-line and reversing starters, direct-on-line soft starters) can be easily and simply integrated into the SIMATIC PCS 7 process control system. The SIRIUS motor starter PCS 7 function block library contains the diagnostics and driver blocks corresponding with the diagnostics and driver concept of SIMATIC PCS 7 as well as the elements required for operation and monitoring (symbols and faceplates) , (see Catalog IC 10, Chapter "Parameterizing, Configuration and Visualization for SIRIUS").

Configuration tool for ET 200S station

The "SIMATIC Selection Tool" enables the fast and accurate selection of SIMATIC hardware. It is available as a configurator in the Siemens Industry Mall free of charge. Assemble your stations (e.g. S7-1200, S7-300, S7-400, S7-400H) and select the desired distributed I/O (e.g. ET 200S, ET 200pro). You can transfer the Parts Lists you received to the Industry Mall shopping cart and place your order quickly, conveniently and with no problems.

You can find detailed information about the ET 200S system at:

www.siemens.com/ET200S

Here you will find a link to the SIMATIC Selection Tool.

Standard motor starters

Functionality of the Standard motor starters

- For basic functionality, see ET 200S motor starters and safety motor starters, General Data, Overview, page 4/5
- Direct-on-line and reversing starters up to 5.5 kW
- Power bus up to 40 A
- With circuit breaker and contactor assembly
- Integrated isolating function of the circuit breaker
- Can be combined with local safety technology for use in safety-related system components with F-Kit and PM-D F modules (see "Accessories" page 4/16)

Device functions (firmware features)

See Catalog ST 70, ET 200S Motor Starters and Safety Motor Starters, General Data, Overview, page 9/142.

High-feature motor starters

Functionality of the High-Feature motor starters

- For basic functionality, see ET 200S motor starters and safety motor starters, General Data, Overview, page 4/5
- Direct-on-line, reversing or soft starter up to 7.5 kW
- Available with wide range and in 3 setting ranges with 0.3...3 A, 2.4...8 A, 2.4...16 A
- With combination of starter circuit breaker, electronic overload protection (parameterizable), and contactor or soft starter
- Power bus up to 50 A
- Upper and lower current limits for plant and process monitoring
- Motor stall protection, zero current detection and asymmetry detection integrated
- The current motor current is measured and transmitted for diagnostics in the cyclic process image
- Control of the motor starter from the control system and extensive diagnostics status via the cyclic process image
- Optional digital inputs available in the cyclic process image and flexibly assignable with functions for adaptation to all applications
- Detection of the switching state of the starter circuit breaker via auxiliary switches and of the contactor via current evaluation
- Integrated isolating function using starter circuit breakers
- Local safety engineering possible (without failsafe kit in the case of the HF starter, because the function of the failsafe kit is already integrated)
- Front-mounting 2DI LC COM control module for another 2 parameterizable digital inputs
- Optional software "Motor Starter ES" for user-friendly commissioning and diagnostics (as of 11/2011 also available for the innovative .-0AB4 starters) (see Catalog Chapter 3)
- PROFIenergy capable[1]
  - Supplying the motor current in PROFIenergy format
  - Switching off during dead times
- Support of all DPV1 acyclic services on PROFIBUS and PROFINET[1]
  - Changing of parameters during operation, e.g. the rated operational current
  - Reading and writing acyclic data for exact diagnostics of the unit or process and for analysis of the plant status

[1] Only for the innovated .-0AB4 starters

Selective protection concept for
ET 200S High Feature motor starters

As a result of the selective protection concept (separate tripping of short circuit and overload) with solid-state overload evaluation, additional advantages are realized on the High-Feature motor starters – advantages which soon make themselves positively felt particularly in manufacturing processes with high plant stoppage costs:

- Only two versions up to 7.5 kW – hence little order variance and stock keeping
- All settings can be parameterized by bus – hence full TIA capability
- Separate signaling of overload and short circuit – enables selective diagnostics
- Overload can be acknowledged by remote reset – ideal for highly automated plants
- Current asymmetry monitoring – complete monitoring of the motor
- Stall protection – complete monitoring of the motor
- Emergency start function in case of overload – operation is possible in an emergency
- Current value transmission via bus – monitoring of the application
- Current limit monitoring
- Trip class can be parameterized – overload trip can be adapted to the application
- Type of coordination "2" – still functional after short circuit with magnitude of 50 kA
- Very high contact endurance

Systems for the control cabinet

ET 200S
Motor Starters and Safety Motor Starters

4

High-Feature motor starters (continued)

ET 200S High-Feature motor starters: DS1e-x direct-on-line starters (innovated .-0AB4 starters)

ET 200S High-Feature motor starters: DS1e-x soft starters (innovated .-0AB4 starters)

ET 200S High-Feature motor starters: Reversing starter RS1e-x (innovated .-0AB4 starter)

PROFIenergy for ET 200S High-Feature motor starters [1]

Increasing energy prices, far-reaching ecological problems worldwide and the threat of climate change make it necessary for you to be more conscious about your use of energy. Active and effective energy management is possible with PROFIenergy.

PROFIenergy is a manufacturer-independent profile on PROFINET, which can be used by all manufacturers, has been standardized by PNO[1] and supports the shut-down of electrical devices during dead times and the read-out of measured values.

The ET 200S HF motor starter supplies the motor current in PROFIenergy format and switches off during dead times.

[1] In the PNO (PROFIBUS Nutzerorganisation e. V. - PROFIBUS User Organization), manufacturers and users have come together to agree on the standardized communication technologies PROFIBUS and PROFINET.

Support of all acyclic services on PROFIBUS and PROFINET [1]

Thanks to the acyclic services, the ET 200S HF motor starters now offer plenty of diagnostics data via data records. There are extensive new options for reading out data from the motor starter for device, system or process monitoring. The motor starter is equipped internally with three logbooks for device faults, motor starter trips and events, which are issued with a time stamp. These logbooks can be read out of the motor starter on demand at any time and provide the plant operator with plenty of information about the state of his plant and process which he can use to carry out improvements.

[1] Only for the innovated .-0AB4 starters

With the slave pointer and statistical data functions it is possible to read out, for example, the maximum internal current values or the number of motor starter connection operations. This enables process deviations to be monitored or commissioning to be optimized.

Statistical data or measured values make plant monitoring easy for the user.

The device diagnostics data record contains details of all the states of the motor starter, the device configuration and the communication as a basis for central device and plant monitoring.

The Installation and Maintenance Functions (I&M) store, firstly, information (I&M) about the modules used in the motor starter and, secondly, data (I&M) that can be defined during configuration, e.g. location designations. I&M functions are used for for troubleshooting faults and localizing changes in hardware at a plant or checking the system configuration.

Supported data records:
- DS 0 S7-V1 system diagnostics (S7 diagnostics alarm)
- DS 72, 73, 75 logbooks, device faults, trips, events
- DS 92 device diagnostics
- DS 93 command
- DS 94 measured values
- DS 95 statistics
- DS 96 slave pointer
- DS 100 device identification
- DS 131 device parameters
- DS 134 maintenance
- DS 165 comment
- DS 226 PROFIenergy technology function
- DS 231 I&M 0 (= device identification)
- DS 232 I&M 1 (= equipment identifier)
- DS 233 I&M 2 (= installation)
- DS 234 I&M 3 (= description)

Device functions (firmware features)

See Catalog ST 70, ET 200S Motor Starters and Safety Motor Starters, General Data, Overview, page 9/142.

Failsafe motor starters

ET 200S Failsafe motor starters: F-DS1e-x direct-on-line starters

The Failsafe motor starter has been developed on the basis of the High-Feature motor starter (.-0AA4 starter). It differs in that, in addition to a motor starter protector and contactor assembly, a safe solid-state evaluation circuit is installed for error detection purposes which makes the motor starter failsafe.

If the contactor to be switched fails in an EMERGENCY-STOP case, the evaluation electronics detects a fault and opens the motor starter protector in the motor starter through a shunt release in a failsafe manner. The second redundant shutdown component is therefore no longer a main contactor, as is generally the case, but the motor starter protector installed in the motor.

All functions of the High-Feature starter are already integrated

The new failsafe motor starters are characterized by easy, space-saving assembly as well as minimal wiring outlay. Like the High-Feature starters, the Failsafe motor starters have a switching capacity of up to 7.5 kW (16 A) which is achieved with just two motor starter versions. Another important feature is the high availability due to the high short-circuit strength (type of coordination "2").

Use

The failsafe motor starter is predestined for use in combination with PROFIsafe (see figure ET 200S Safety Motor Starter Solution PROFIsafe with Failsafe Motor Starters on page 4/15). Another field of application is in combination with ASIsafe or safety relays (see example 2 on page 4/13 Failsafe Motor Starters with ASIsafe and 3TK28).

High degree of flexibility with safety technology

PROFIsafe solution with PM-D F PROFIsafe

In EMERGENCY-STOP applications, the Failsafe motor starters are selectively switched off through the upstream PM-D F PROFIsafe safety module. For each safety module, six switch-off groups can be formed. In the first delivery stage, the failsafe freely-programmable logic of the SIMATIC controller is used to interface with the relevant Failsafe sensor technology. The interface between PROFIsafe and installations that use conventional safety technologies is implemented through the F-CM Failsafe contact multiplier with four floating contacts.

Solution local with PM-D FX1

Failsafe motor starter with safety relay (Version 1) or ASIsafe (Version 2, see example 2, page 4/13):
Signals with relevance for safety can be input to ET 200S through a PM-D F X1 infeed terminal module through the enabling circuits of the AS-i Safety Monitor or the safety relay to control the Failsafe motor starters which then selectively switch off the downstream motors.

4

Safety modules local and PROFIsafe (continued)

Components for ET 200S Safety motor starter Solution local

The ET 200S Safety motor starter Solutions local comprising:

Version 1 (see example 1, page 4/13):
• Safety modules PMD F1 ... 5
• PM-X module
• Standard motor starter or High-Feature motor starter

Version 2 (see example 2, page 4/13):
• PM-D FX1 safety module
• Failsafe motor starters

Functionality of the ET 200S Safety motor starters Solutions local

• For use of Standard, High-Feature or Failsafe motor starters in systems with safety categories 2 to 4 (according to ISO 13849-1)
• Can also be used in combination with external safety relays
• Can also be used to activate external safety systems
• No complex wiring for conventional safety technology
• Safety module available for function-monitored and automatic starting
• Safety module available for Stop category 0 and 1
• Safety module for monitoring the auxiliary voltages for motor starters
• Safety modules can be plugged into the TM-PF30 terminal modules

With Safety motor starters Solutions local the highest safety category can be reached according to ISO 13849-1 and IEC 62061. They can thus be used for evaluation of EMERGENCY-STOP circuits or for monitoring protective doors and also for time-delayed disconnections. With the contact multiplier the safety-relevant signals can also be made available to external systems.

All standard safety applications can be covered through combination of different TM-PF30 terminal modules. Needless to say, ET 200S motor starters can also be used in conjunction with external safety relays or with ASIsafe.

Safety motor starter Solutions local reduce wiring by up to 80% compared to conventional safety systems with local safety applications.

With the Safety motor starters Solutions local it is easy to configure several safety circuits. The safety sensors are connected directly and locally to the safety modules. These safety modules perform the work of the otherwise obligatory safety relays and safely shut down the downstream motor starters in accordance with the function selected. The crosslinks required for this are already integrated in the system and need no additional wiring. All signals from the safety modules are automatically relayed as diagnostic signals, e.g. in the event of crossover in the EMERGENCY-STOP circuit.

The safety module evaluates the signal state of the connected safety sensors and, using the integrated safety relays, shuts down the group(s) of downstream motor starters. The shutdown function is monitored by the module, and the auxiliary voltages likewise.

Safety-relevant system signals, e.g. due to an actuated EMERGENCY-STOP switch or a missing auxiliary voltage, are automatically generated and notified to the interface module. The latter assigns an unambiguous ID to the fault. Using the PROFIBUS DP diagnostics block, faults of this type can be identified and localized without a great deal of programming work.

PM-D F1/F2/F3/F4/F5 safety modules

• PM-D F1/F2/F3/F4 safety modules monitor auxiliary voltages and contain the complete functionality of a safety relay:
  - PM-D F1: For evaluation of EMERGENCY-STOP circuits with the function "monitored start"
  - PM-D F2: For the monitoring of protective doors with the function "automatic start".
  - PM-D F3 : Expansion to PM-D F1/F2 for time-delayed tripping.
  - PM-D F4: For the expansion of safety circuits with other ET 200S motor starters, e.g. in a different tier.
  - PM-D F5: Transmits the status from PM-D F1 ... 4 via four floating enabling circuits to external safety devices (contact multipliers)
• The PM-D F1 and PM-D F2 modules can be combined with the PM-D F3 or PM-D F4 modules.
• A PM-D F5 can be positioned at any point between a PM-D F1 ... 4 and a PM-X[1].
• Safety modules monitor the U1 and U2 auxiliary voltages. A voltage failure is relayed as a diagnostic signal over the bus.
  - No additional PM-D safety module is required when the safety modules are used.
  - Each safety circuit, beginning with a PM-D F1 ... 4, must be terminated with one PM-X each [1].

[1] See Catalog ST 70 Accessories for Safety Module Local, page 9/173

PM-D F1 safety module

PM-D FX1 safety module

The PM-D FX1 safety module is used for feeding in 1 to 6 switch-off groups. The infeed voltage can be switched using 1 to 6 external safety shutdown devices (either ASIsafe monitors or 3TK28 safety relays). This safety module is used in applications with external safety shutdown devices where there is a need for the fully selective safety shutdown of failsafe motor starters/frequency converters (see Example 2, page 4/13).

Terminal modules for (TM-PF30) safety module

For supplying load and sensor voltage to the potential bars of the motor starters, and for connection of the 2-channel sensor circuit (e.g. EMERGENCY-STOP pushbutton) and a reset button. Different terminal modules are available for the configuring of separate safety circuits or for the cascading of safety circuits, and for applications with time-delayed disconnection (see page 4/16).

4

SIMATIC ET 200 Distributed I/O
Systems for the control cabinet

ET 200S
Motor Starters and Safety Motor Starters

Safety modules local and PROFIsafe (continued)

Terminal module (TM-X)

For connection of an external infeed contactor (2nd shutdown possibility). With terminals for contactor coil and feedback contact. Is always required to terminate a group of safety-oriented motor starters.

Failsafe Kit

The Failsafe Kit (F-Kit) must be added to each Standard motor starter in a safety segment in order to monitor the switching function.

F-Kit 1 supplements the DS1-x direct-on-line starter, F-Kit 2 the RS1-x reversing starter.

The F-Kits are comprised of:
- Contact supports for the terminal modules
- One or two auxiliary switch blocks for the contactor/contactors of the motor starter
- Connecting cables

High-Feature motor starters and their terminal modules come as standard with the functionality of the F-Kits integrated.

Safety modules local and PROFIsafe (continued)

Examples

The diverse possible uses of the safety motor starter Solutions local are presented in the manual SIMATIC ET 200S Motor Starters in the context of typical sample applications.

Safety functional examples for easy, quick and low-cost implementations of applications with Safety motor starters Solutions local are available on the Internet:

You can find more information on the Internet at:

www.siemens.com/ET200S-motorstarter

Example 1:

ET 200S Safety motor starter Solutions local with 2 safety circuits (= switch-off groups), Standard motor starters and High Feature motor starters.

Example 2:

ET 200S safety motor starter Solutions local with 2 external safety combinations (= safety relays or ASIsafe monitors) and with Failsafe motor starters (PM-DFX1 application). 2 of the 6 available safe switch-off groups are used.

Signals with relevance for safety can be input to ET 200S through a PM-DFX1 infeed terminal module through the enabling circuits of the ASIsafe monitor or the safety relay to control the Failsafe motor starters which then selectively switch off the downstream motors.

Safety modules local and PROFIsafe (continued)

ET 200S Safety motor starter Solutions PROFIsafe

Interplay of ET 200S Safety motor starter Solutions PROFIsafe components

Components for ET 200S Safety motor Starter Solution PROFIsafe

The ET 200S Safety motor starter Solutions PROFIsafe consists of (see example, page 4/15):

• PMD F PROFIsafe safety modules
• Failsafe motor starters
• Safe control system is used with the PROFINET or PROFIBUS bus systems with the PROFIsafe profile

Functionality of the ET 200S Safety motor starter Solutions PROFIsafe

• For the use of Failsafe motor starters in plants with safety category 2 to 4 according to ISO 13849-1 and SIL 2 and 3 acc. to IEC 62061. The use of Standard or High-Feature motor starters is also possible with certain assemblies
• High flexibility (any assignment of sensors to motor starters using the PLC)
• Full selectivity of disconnection of the Failsafe motor starters
• No complex wiring for conventional safety systems, e.g. no infeed contactors even in the highest safety category

• Can also be used to activate external safety systems through F-CM contact multiplier
• Safety module available for any safety function
• Safety module available for Stop category 0 and 1
• Safety module for monitoring the auxiliary voltages for motor starters
• Safety modules can be plugged into the TM-PF30 terminal modules

Sensor and actuator assignment are freely configurable within the framework of the distributed safety concept:

The logic of the safety functions is implemented by software. Safety-oriented PROFIsafe communication and the use of a safety-oriented control system are required. Integration of the safety technology in the standard automation is realized through a single bus system (see Advantages of PROFIsafe), using PROFIBUS as well as PROFINET.

■ **Safety modules local and PROFIsafe** (continued)

High degree of flexibility with safety technology
Failsafe motor starters for PROFIsafe

In EMERGENCY-STOP applications, the Failsafe motor starters
are selectively switched off through the upstream
PM-D F PROFIsafe safety module. For each safety module, six
switch-off groups can be formed. In the first delivery stage, the
failsafe freely-programmable logic of the SIMATIC controller is
used to interface with the relevant Failsafe sensor technology.

F-CM contact multipliers

The interface between PROFIsafe and installations that use
conventional safety technologies is implemented through the
F-CM Failsafe contact multiplier with four floating contacts.

PM-D F PROFIsafe safety modules

The PM-D F PROFIsafe safety module receives the shutdown
signal from the interface module of the ET 200S and safely
switches off 1 to 6 switch-off groups. This safety module is used
in PROFIsafe applications where there is a need for the selective
safety shutdown of Failsafe motor starters/frequency converters.

PM-D F PROFIsafe with TM-PF30 S47-F0 terminal module

Terminal modules

The terminal assignment of the terminal modules for safe motor
starters corresponds to the terminal assignment of the 45 and
65 mm terminal modules. The terminal modules for safe motor
starters have a coding module in addition. This enables the safe
motor starter to be assigned to one of the six switch-off groups.

The terminal module contains three coding elements which fully
cover the three coding openings in the terminal module. The la-
beled coding element contains (in the chamber marked with the
dash) the busbar tap; the non-labeled coding elements are used
only to cover the coding openings. Switch-off group 1 (AG1 or
SG1) is coded in the as-delivered state. The coding can be
changed to switch-off group 2 by releasing the coding element
and turning it through 180°. Changing the coding to switch-off
group 3 is possible by exchanging the labeled and blank coding
elements. In this case the dash on the labeled coding element
must correlate with the dash of the required switch-off group
(symbolized busbar).

The Failsafe motor starters are assigned to one of the six possible
switch-off groups.

Example:

The diverse possible uses of the Safety motor starter Solutions
PROFIsafe are presented in the manual SIMATIC ET 200S Motor
Starters in the context of typical sample applications.

Safety functional examples for easy, quick and low-cost imple-
mentations of applications with safety motor starters Solution
PROFIsafe are available on the Internet:

Systems for the control cabinet

ET 200S
Motor Starters and Safety Motor Starters

4

Safety modules local and PROFIsafe (continued)

Within an ET 200S station the Failsafe motor starters are assigned to one of 6 safety segments. For plants with distributed configuration the shutdown signals of these safety segments are preferably issued by a higher-level, safety-oriented control system through PROFIsafe. This permits the greatest flexibility for assigning the motor starters to different safety circuits.

Alternatively, an ET 200S F-CPU can also be used for control purposes.

If a safety-oriented SIMATIC CPU is used, the ET 200S is available as a safety-oriented peripheral. Nevertheless, in such a station it is possible to configure conventional motor starters and input/output modules mixed with modules with safety functions.

Thanks to the PROFIsafe profile, the safety functions are available in the complete network, which means that the Safety motor starter Solutions PROFIsafe enable the selective disconnection of a Failsafe motor starters or the disconnection of a group of Standard and High-Feature motor starters regardless of where and on which peripheral station the safe control devices were connected. As such, this solution provides an unprecedented level of flexibility and reduction of wiring for applications in wide-spread plants or with a sporadic demand for changes in the assignment of safety segments.

The PROFIsafe safety motor starters Solution are ideally suited for safety concepts with Cat. 2 to 4 according to ISO 13849-1 and up to SIL 3 according to IEC 62061.

Each safety module switches up to 6 switch-off groups for Failsafe motor starters/frequency converters.

Accessories

Accessories for Standard motor starters

Control kit

The control kit for the Standard motor starter provides the possibility of testing the motor during start-up or service by actuating the motor starter protector. Using the control kit with the motor starter protector tripped, the contactor is mechanically locked in ON position.

Control unit

With the control unit the contactor coils of the Standard motor starter can be directly controlled using 24 V DC. The motor starter can thus be started as normal using a local control station without PLC or bus.

Note:
The control unit cannot be used in combination with the safety technology or a brake control module.

DM-V15 distance module

- Passive module without bus connection and terminals
- Does not need a separate terminal module
- Follows a TM-DS45 or TM-RS90 or TM-xB if required
- Does not need to be taken into account when configuring the GSD file

The distance module is available for applications with high motor currents or high ambient temperatures involving Standard motor starters. It can be used to the right and left of a DS1-x direct-on-line starter or to the right of an xB1-4 brake module in order to improve heat removal to the side. The distance module is a completely passive module and does not need to be taken into account with regard to the control system during configuration. Details of the distance module can be found in the manual "SIMATIC ET 200S". If you have any queries concerning the use of the distance module, contact Technical Support for Siemens Low-Voltage Controls and Distribution (fax: +49(0)911/895-5907).

Accessories for High-Feature motor starters

2DI 24 V DC COM control module

The 2DI 24 V DC COM control module is plugged onto the interface on the front of the motor starter. The module provides two inputs which can receive signals from the process and be assigned directly to the starter.

The functionality can be selected from a list of various control functions as part of the PROFIBUS parameterization. Local control station, emergency start and quick stop, for example, are available as functions. The signal levels can also be parameterized (NO/NC). For more extensive control functions the two inputs of a xB3 or xB4 brake control module, which is plugged in alongside on the right, can be integrated in addition. The signal states of all inputs are transmitted in parallel with the internal use to the higher-level control system.

When a motor starter is replaced, the parameterization is automatically transmitted by download to the new starter. The inputs on the motor starter ensure autonomous operation, e.g. in the event of PLC failure, on the one hand, and short response times through direct processing in the starter on the other hand. Another advantage results from the direct assignment of functions to modular machine concepts.

The 2DI 24 V DC COM control module has in addition a PC interface for connecting the Switch ES Motor Starter parameterization and diagnostics software (Version 2.0 and higher). The module works solely on High-Feature motor starters with ES Motor Starter interface. The Logo!-PC cable is used as connecting cable between the 2DI 24 V DC COM control module and the High-Feature motor starter.

Accessories (continued)

Accessories for Standard and High-Feature motor starters

PE/N bridge module

PE/N bridge modules are used to bridge gaps in the PE/N bus which are caused, for example, by using brake control modules, PM-D(F) power modules or PM-X connection modules. If a bridge module is used, the supply must not be fed in anew. They are available in widths of 15 and 30 mm.

L123 bridge modules

The L123 bridge modules are used to bridge gaps in the power bus (see above). They are available in widths of 15 and 30 mm.

Brake control module

For motors with mechanical brakes (see also ET 200S Motor Starters and Safety Motor Starters, General Data, Overview, Section Brake Control Module, page 4/5)

Terminal modules for brake control modules

The TM-xB terminal modules are used to accommodate the xB1, xB2, xB3 and xB4 brake control modules. The TM-xB terminal module must always follow directly after a terminal module for Standard motor starters, High-Feature motor starters or frequency converters as control of the solid-state braking switch is provided through an output of the motor starter/frequency converter. The xB215 terminal modules for the brake control modules have not only the terminals for connecting the cable for the motor brake but also the terminals of the two local acting inputs. These local inputs are not evaluated by a frequency converter, which is why the xB215 terminal module can only be switched behind a motor starter.

Accessories for Standard, High Feature, Failsafe motor starters

PE/N terminal blocks

The PE/N terminal block is required for direct connection of the protective conductor in the motor cable without intermediate terminals. It is plugged together with the terminal module for motor starters or frequency converters before the latter is mounted on the standard mounting rail. With two PE terminals and one N terminal the "-F" version is connected to the "-S32" terminal modules for motor starters or frequency converters. The "-S" version is combined with the "-S31" terminal module. The "F" terminal modules are delivered with two caps for closing the PE/N bus contacts on the final terminal module of a segment. The modules for the Standard motor starters have a width of 45 mm and the modules for the High-Feature motor starters and frequency converters have a width of 65 mm.

There is no electrical connection between the terminals of the PE/N terminal block and the integrated shielding of the frequency converter. The PE/N terminal block must therefore not be used for the shielding of the motor cable.

Accessories for Safety modules local

The Failsafe Kit (F-Kit) is required for Standard motor starters in a safety segment (see Safety Module local and PROFIsafe, Overview, page 4/12).

SIMATIC ET 200 Distributed I/O
Systems for the control cabinet

ET 200M

◼ Overview

- Modular peripheral system in IP20 degree of protection, which is particularly suited for user-specific and complex automation tasks.
- Expandable by the signaling, communication and functional modules of the S7-300 automation system

- The explosion analog input and output modules with HART optimize the ET 200M for use in process engineering
- Can be used with redundant systems (S7-400H, S7-400F/FH)
- Consists of a PROFIBUS DP connection IM 153, up to 8 or 12 I/O modules of the S7-300 automation system (designed with bus connectors or with active bus modules) and possibly also a power supply
- Replacement of modules during operation (hot swapping) with active bus modules
- Optionally with integral FO interface
- Transmission rate up to 12 Mbit/s
- Ex approval according to Cat. 3 for Zone 2 according to ATEX 100 a
- Failsafe digital inputs and outputs and analog inputs for safety-oriented signal processing according to PROFIsafe
- Support of modules with expanded user data, e.g. HART modules with HART additional variables

ET 200L

◼ Overview

The ET 200L is a small, compact I/O station in IP20 degree of protection.

The ET 200L is primarily used where few inputs/outputs are required in the lower performance range and where little space is available.

The ET 200L is a passive station (slave) in the PROFIBUS DP with transmission rates of up to 1.5 Mbit/s.

SIMATIC ET 200 Distributed I/O
Systems for the control cabinet

ET 200iSP

Overview

- Intrinsically safe distributed I/O system in IP30 degree of protection for use in gas and dust areas with an explosion hazard, i.e. in Zone 1 and 2 as well as 21 and 22
- Sensors and actuators can lie directly in Zone 0 and 20
- Individual configuration and flexible expansion thanks to modular design for optimal adaptation to the current automation task
- Permanent wiring permits prewiring without existing electronics
- Optimal integration into control systems (e.g. SIMATIC PCS 7)
- Parameterization via SIMATIC PDM
- Optimal integration of HART field devices (HART transparency)
- Failsafe digital inputs and outputs and analog inputs for safety-oriented signal processing according to PROFIsafe
- Connection to PROFIBUS DP via isolating transformers
- Module exchange (hot swapping) and configuration expansion (Configuration in Run) possible during operation
- Comprehensive diagnostic signals
- Moisture-resistant modules in temperature range -20 °C to +70 °C
- EMC according to NE 21 (on Namur recommendation)
- Full redundancy of PROFIBUS and power supply

4

SIMATIC ET 200 Distributed I/O
Systems without control cabinet

ET 200pro

Overview

- Distributed I/O system in IP65/67 degree of protection for cabinet-free, machine-level use
- Small, multifunctional complete solution: Digital inputs/outputs, failsafe modules, motor starter up to 5.5 kW, frequency converter up to 1.5 kW, etc.

- Communication via PROFIBUS or PROFINET
- Mixture of failsafe modules and standard modules possible in a single station
- Free choice of connection technology: direct, ECOFAST or M12 7/8"
- Power module for simple realization of load groups
- Module exchange during operation (hot swapping)
- Simple assembly and permanent wiring
- Transmission rate up to 12 Mbit/s
- Comprehensive diagnostics: module- or channel-specific
- Intelligent motor starter for the starting and protection of motors and loads up to 5.5 kW
  - Versions: Direct-on-line and reversing starters - Standard and High Feature
- Frequency converter up to 1.5 kW in standard version and with integral safety functions
- Failsafe module with safety-oriented signal processing according to PROFIsafe

General data

ET 200pro motor starter: Isolator module, Standard starter and High-Feature starter mounted on a wide module rack

Motor starters
- Only two versions up to 5.5 kW
- All settings can be parameterized by bus
- Comprehensive diagnostic signals
- Overload can be acknowledged by remote reset
- Current unbalance monitoring
- Stall protection
- Emergency start function in the event of overload
- Current value transmission by bus
- Current limit monitoring
- Direct-on-line or reversing starters
- Power bus can be plugged in using the new HAN Q4/2 plug-in connectors
- Conductor cross-sections up to 6 x 4 mm^2
- 25 A per segment (power looped through using jumper plug)
- In the Standard and High-Feature versions (with 4 DI onBoard)
- Electromechanical switching and electronic switching
- Electronic starter for direct activation or with integrated smooth-starter function
- Supplied with 400 V AC brake contact as an option

Isolator modules

The isolator module with switch disconnector function is used for safe disconnection of the 400 V operational voltage during repair work in the plant and provides an integrated group fusing function (i.e. additional group short-circuit protection for all subsequently supplied motor starters).

Depending on the power distribution concept, all stations can be equipped with an isolator module as an option.

Safety applications

Safety local isolator module

With the Safety local modules
- Safety local isolator module and
- 400 V disconnecting module
it is possible to achieve safety category 4/SIL 3 with an appropriate connection.

Safety Solution PROFIsafe

With the Safety PROFIsafe modules
- F-Switch and
- 400 V disconnecting module
it is likewise possible to achieve safety category 4/SIL 3 with an appropriate connection.

Motor Starter ES software

Motor Starter ES software for parameterization, monitoring, diagnostics and testing of motor starters.
(See Chapter 3).

Functionality

With the ET 200pro motor starters, any AC loads can be protected and switched. They are an integral part of ET 200pro and have the high degree of protection IP65. This makes them ideal for operation in modular, distributed I/O without control cabinets or control enclosures.

The ET 200pro motor starters are available both with mechanical as well as electronic contacts

The ET 200pro electromechanical starters are offered as direct (DSe/DSe) and reversing starters (RSe/RSe) in the High Feature version with the following equipment:
- 4 digital inputs
- Device versions with or without control for externally fed brakes with 400 V AC
- With expanded parameterization capabilities.

The ET 200pro electronic starters are offered as direct (sDSSte/sDSte) and reversing starters (sRSSte/sRSte) in the High Feature version with the following equipment:
- 4 digital inputs
- With soft-start and smooth ramp-down function
- With the deactivated smooth start function as an electronic starter for applications with a high level of switching frequency
- Device versions with or without control for externally fed brakes with 400 V AC
- With expanded parameterization capabilities.

As the result of the protection concept with solid-state overload evaluation and the use of SIRIUS controls size S00, additional advantages are realized on the standard and High-Feature motor starters - advantages which soon make themselves positively felt particularly in manufacturing processes with high plant stoppage costs:

- Configuration is made easier by the fine modular structure. When using the ET 200pro motor starters, the list of parts per load feeder is reduced to two main units: the bus module and the motor starter. This makes the ET 200pro ideal for modular machine concepts or solutions for conveying systems and in machine-tool building.

- Expansions are easily possible through the subsequent adding of modules. The innovative plug-in technology also does away with the wiring needed up to now. Through the hot swapping function (disconnection and connection during operation) a motor starter can be replaced within seconds if necessary, without having to shut down the ET 200pro station and with it the process in the plant. The motor starters are therefore recommendable in particular for applications with special demands on availability. Storage costs are optimized in addition by the low level of variance (2 units up to 5.5 kW).

The ordering option for motor starters with a 400 V AC brake output provides the possibility of controlling motors with 400 V AC brakes. With four locally acting inputs available on the High-Feature motor starter it is possible to realize autonomous special functions which work independently of the bus and the higher level control system, e.g. as a quick stop on gate valve controls or limit position disconnectors. In parallel with this, the states of these inputs are signaled to the control system.

Solutions local – Safety Module

ET 200pro motor starter: Safety local isolator module, disconnecting module, Standard starter and High-Feature starter mounted on a wide module rack

Safety local isolator module

The Safety local isolator module is a repair switch with integrated safety evaluation functions that can be parameterized using DIP switches.

It is used for:
- Connection of a 1 or 2-channel EMERGENCY-STOP circuit up to Cat. 3-4/SIL 3 (protective door or EMERGENCY-STOP pushbuttons) and parameterizable start behavior
- Control of the 400 V disconnecting module by means of a safety rail signal

400 V disconnecting module

The 400 V disconnecting module enables the safe disconnection of an operational voltage of 400 V up to Category 3-4/SIL 3. For operation in a Safety Solution local application it functions only in combination with the Safety local isolator module.

For operation in a Safety PROFIsafe application it functions only in combination with the F-Switch.

F-Switch

Fail-safe digital inputs/outputs in degree of protection IP65/66/67 for near-machine, cabinet-free use.

Fail-safe digital inputs

- For the failsafe reading in of sensor information (1-/2-channel)
- Including integrated discrepancy evaluation for 2v2 signals
- Internal sensor supplies (incl. testing) available

Fail-safe digital outputs

- 3 failsafe PP-switching outputs for safe switching of the backplane busbars

The F-Switch is certified up to Cat. 4 (EN 954-1) and up to SIL 3 (IEC 61508) and has detailed diagnostics.

It supports PROFIsafe in PROFIBUS configurations as well as in PROFINET configurations.

Functionality

Safety local isolator module

The Safety local isolator module features the same functions as a standard isolator module with an additional local safety function.

The Safety local isolator module contains a 3TK28 41 module and is equipped with M12 terminals for the connection of external safety components.

Terminals 1 and 2 can be used to connect either 1-channel or 2-channel EMERGENCY-STOP circuits or protective door circuits (IN 1, IN 2).

For monitored starts, an external START switch can be connected to terminal 3.

The required safety functions can be set using 2 slide switches located under the left M12 opening.

In the event of an EMERGENCY-STOP, the Safety local isolator module trips the downstream 400 V disconnecting module. This safely isolates the 400 V circuit up to Cat. 4/SIL 3.

In combination with the 400 V disconnecting module, the Safety local isolator module can be used for safety applications up to Cat. 4/SIL 3 according to EN 13849-1 / IEC 61508 1-4.

400 V disconnecting module

The 400 V disconnecting module can be used together with the Safety local isolator module for local safety applications and together with the F-Switch for PROFIsafe safety applications.

It contains two contactors connected in series for safety-oriented disconnection of the main circuit.

The auxiliary circuit supply of the device is over a safety power rail in the backplane bus module.

The 400 V disconnecting module can be used together with the Safety local isolator module or with the F-Switch for safety applications up to Cat. 4/SIL 3 according to EN ISO13849-1 / IEC 61508 1-4.

F-Switch

The F-Switch is a failsafe solid-state module for PROFIsafe safety applications. It has two failsafe inputs and outputs for safe switching of the 24 V supply over backplane busbars. In combination with the 400 V disconnecting module it can be used in PROFIsafe applications for the failsafe disconnection of ET 200pro motor starters up to Cat. 4/SIL 3.

  www.siemens.com/et200 (general)

Overview

- Compact block I/Os for processing digital, analog and IO-Link signals for connecting to the PROFINET bus system
- Construction without control cabinet, degree of protection IP65/66/67 with M12 connection method
- Very robust and resistant metal casing and enclosure

- Compact module in two enclosure forms:
  - 30 mm x 200 mm x 37 mm (W x H x D, long and narrow enclosure) with 4 x M12 for digital signals
  - 60 mm x 175 mm x 37 mm (W x H x D, short and wide enclosure) with 8 x M12 for digital signals and IO-Link
  - 60 mm x 175 mm x 37 mm (W x H x D, short and wide enclosure) with 4 x M12 or 8 x M12 for analog signals
- PROFINET connection: 2 x M12 and automatic PROFINET addressing
- Data transmission rate 100 MBit/s
- LLDP proximity detection without PG and Fast Startup (starting within approx. 0.5 s)
- Supply and load voltage connection: 2 x M12
- Module variance:
  - 8 DI,
  - 16 DI,
  - 8 DO (2 A),
  - 8 DO (1.3 A),
  - 8 DO (0.5 A),
  - 16 DO (1.3 A),
  - 8 DI/DO (1.3 A),
  - 8 AI (U, I, TC, RTD),
  - 4 AO (U, I),
  - 4 IO-Link + 8 DI + 4 DO (1.3 A)
- Channel-specific diagnosis

SIMATIC ET 200 Distributed I/O
Systems without control cabinet

ET 200eco

Overview

- Compact, economical, I/O peripherals for the processing of digital signals
- Cabinet-free design in IP65/67 degree of protection with flexible and rapid connection technology

- Consists of basic module and various connection blocks for application-adapted realization options:
  - ECOFAST: 2 x RS 485 hybrid field bus connections with identification plug for PROFIBUS address setting
  - M12: 2 x M12 and 2 x 7/8" with 2 rotary coding switches for PROFIBUS address assignment
- Connection block includes T functionality for bus and voltage supply so that the module can be removed from and reconnected to PROFIBUS without interruption during commissioning and service
- Module variance: 8DI, 16DI, 8DI/8DO (1.3 A), 8DI/8DO (2.0 A), 8DO (2.0 A), 16DO (0.5 A)
- Transmission rates up to 12 Mbit/s
- Failsafe DI module with 4/8 F-DI with safety-oriented signal processing according to PROFIsafe

SIMATIC Ident Identification Systems

Introduction

Overview

SIMATIC Ident – for more economic production and logistics processes

Fiercer competition, stricter standards and legal regulations, shorter product life cycles, more individual customer requirements and increasingly globalized value-adding chains: to stay ahead in dynamic markets, companies must increase the efficiency of their value-adding chains – in production control, asset management, tracking & tracing as well as in supply chain management. Through the use of innovative identification technology, companies gain an important advantage.

But what is best: RFID or optical code reading systems? What is the right technology for the specific application? Where is alternative use relevant, where is joint use relevant, and how flexibly will you be able to respond to different requirements? Siemens can help you here. With SIMATIC Ident, we are offering you a comprehensive portfolio that covers all aspects of industrial identification, supplies you with the perfect solution for your requirements, and gives you flexibility for the future.

Both technologies build a single system.

The right identification technology depends on factors such as sensing distance, lighting conditions, single or repeat markings, as well as environmental effects such as temperature and pollution. Depending on the application, optical and RFID systems can be used in the same production line alongside each other in the form of a hybrid solution, e.g. DMC for direct part marking on the product and RFID for pallets or workpiece carriers.

Easy integration in Totally Integrated Automation

In this case, seamless interlinking of both technologies and the continuous integration into the automation or IT level is necessary.

With our SIMATIC Ident portfolio we can offer you the right solution for this:
Using joint communication modules and function blocks, SCALANCE switches or IWLAN Access Points, Siemens offers a complete connection to SIMATIC PLC for all applications.

This ensures that you have a system-wide, uniform software architecture as well as communication and saves considerable outlay and costs in engineering, commissioning and maintenance.

5

SIMATIC identification systems in the automation environment

■ **Overview** (continued)

Identification systems: RFID and optical codes

Whether barcode, DMC, RFID or OCR: every technology has its specific strengths. Character recognition is used for cases in which codes must also be readable by persons, such as use-by dates.

2D codes and RFID impress customers with their high level of data security and have proved reliable even under harsh industrial conditions. The decisive criterion for an identification system: your individual application.

Code reading systems: Verification, identification

When higher performance is required, 2D codes are recommended as an alternative to barcodes, because they offer greater memory capacity and a better read rate. They can be applied inexpensively, e.g. together with shipping labels. They also enable the products to be marked directly (Direct Part Marking, DPM) using lasers, printing or nail punching, which is extremely resistant to external influences. 2D codes can be read with complete reliability even from a small viewing angle or under difficult lighting conditions.

With SIMATIC code reading systems, we offer you the ideal solution for reading and verifying 1D and 2D codes as well as for text recognition (OCR) - for the reliable tracing of production batches beyond the manufacturing plant.

RFID: Identification, mobile data storage

RFID is the ideal solution when there is no line of sight between the reader and the marking, large volumes of data or wide ranges are required, or the stored information has to be changed. Here the product or object is fitted with a memory chip that can be programmed and read using radio techniques. With low-cost Smart Labels available for logistics, rugged data memories for assembly lines as well as transponders with a wide range, RFID is perfectly suited to a variety of different applications.

Our intelligent SIMATIC RF system family offers you transparency without gaps. Data is therefore available at any time along the complete production and distribution chain – for perfect control and optimization of material flow and logistics.

Introduction

Overview

***RFID systems –
for optimization of material flow and logistics***

As the world-leading supplier of RFID systems, Siemens offers a unique scalable portfolio for flexible and cost-effective solutions.

RFID systems are offered for the most diverse requirements on performance, range, frequency range as well as HF and UHF.

Easy integration of the RFID systems via communication modules and pre-configured software blocks in the world of Totally Integrated Automation significantly reduces the outlay and costs for commissioning, diagnostics and maintenance.

Thanks to many years of experience in the area of RFID, Siemens is a competent partner for implementation of the most diverse solutions in all sectors, but especially in the areas of production and logistics.

Meaningful data from the outset

The RFID systems ensure that meaningful data accompanies a product or object from the very beginning. The transponders are attached to the product, product carrier, object, or its transport or packing unit and are written to contact-free. This means that all the application-specific data is located on the transponder. This is true whether you are dealing with vehicle body parts in the automotive industry or order picking boxes.

Up to 64 KB of data can be stored and individually read and supplemented when required at the various workstations or manufacturing stations. This all means that the flow of material and data is synchronized optimally.

Contactless data transfer and a high degree of industrial compatibility

Powerful readers (read/write devices) in various rugged designs ensure fast and reliable data transfer between the transponders and the higher-level systems (e.g. PLC, PC).

The data and power are transmitted inductively by an electromagnetic alternating field or by radio waves. This principle of contactless data transfer works reliably in the presence of contamination or through non-metallic materials.

Perfectly matched components

The RFID systems consist of perfectly matched individual components:

- Transponder
- Readers
- Antennas
- Communication modules for connection to the automation system (e.g., PROFIBUS, PROFINET)
- Software for system integration

For a wide range of applications in all sectors

- Production control
- Asset management
- Tracking & tracing
- Supply chain

Wide range of transponders

A wide range of different transponders is available using a variety of storage technologies (fixed code, EEPROM or FRAM/SRAM) and geometric designs. Their strength is not only their high level of data security but also the excellent high degree of protection against ambient conditions such as contamination, temperature fluctuations, washing water or shock load.

Flexible system integration

A wide range of communication modules, function blocks, as well as high-performance drivers and function libraries permits easy and quick integration into the application.

And best of all: SIMATIC RFID is part of Totally Integrated Automation and can be integrated easily and cost-effectively into the SIMATIC world.

For more details on the connection possibilities, see the respective chapters of the communication modules at PROFINET/Indstrial Ethernet, PROFIBUS and ET 200 Distributed Peripherals.

Benefits

- Flexible and economic solutions thanks to the complete and scalable portfolio for the field of industrial identification.
- Simplified engineering, commissioning, diagnostics and maintenance through seamless integration into Totally Integrated Automation:
  - Integrated bus connection to an automation system, such as SIMATIC, SIMOTION or SINUMERIK via communication modules with PROFIBUS and PROFINET.
  - Simple S7 software integration via ready-to-use function blocks.
  - Integrated diagnostic functions.
- High degree of investment protection thanks to:
  - Open standards (e.g. ISO 15693, ISO 18000-6C).
  - Software compatibility between the RFID systems of Siemens AG.
  - Standardized communications interfaces.
- Openness through connection possibilities to different bus systems from different manufacturers and PC environments via communication modules.
- Worldwide Service and Support.

SIMATIC RF200	SIMATIC RF300

■ Overview

The RFID system SIMATIC RF200 is, thanks to its compact and low-cost reader, particularly suitable for use in industrial production in the areas of small assembly lines and intralogistics.

With RF200, identification tasks of medium-performance in the HF range (13.56 MHz, ISO 15693) can be implemented extremely cost effectively. RF200 readers can be operated with all ISO transponders of the product range of MOBY D (MDS Dxxx).

■ Overview

The RFID system SIMATIC RF300 is particularly suitable for use in industrial production in the areas of production control, assembly lines and conveyors.

SIMATIC RF300 is used to implement identification tasks with medium to high performance in the HF range (13.56 MHz).

Depending on the demands on the performance of the identification system, three versions of the system are available:

- A particularly economical solution with a link to SIMATIC S7-300 over the IQ-Sense interface for low requirements in terms of speed and data volume.
- Medium performance: System configuration with SIMATIC RF300 readers in ISO 15963 mode and low-cost MOBY D transponders.
- High performance: System configuration with SIMATIC RF300 readers in RF300 mode and SIMATIC RF300 transponders.

SIMATIC Ident Identification Systems

RFID systems

MOBY D	SIMATIC RF600

■ Overview

The RFID system MOBY D is particularly suitable for use in industrial production in the areas of production control, asset management and tracking & tracing.

MOBY D is used to implement identification tasks with medium to high performance (ISO 15693) in the HF range (13.56 MHz) that require particularly high ranges.

MOBY D offers a comprehensive portfolio of ISO 15693 transponders for a whole variety of requirements - from low-cost SmartLabels for simple identification tasks through rugged credit card formats, right up to transponders for use in especially harsh environments such as paint shops or in the laundry and cleaning industry.

Depending on the read/write distance, different readers are available with integrated or remote antennas.

■ Overview

Identification tasks in the UHF range (865 to 868 MHz and 902 to 928 MHz) that demand a wide range of up to 5 m are implemented with SIMATIC RF600. The system is suitable for storing and recording a unique identification according to the EPCglobal standard (Electronic Product Code) on products, containers or transport units. Storage of additional, freely-definable user data is also possible.

Various data carriers - from low-cost SmartLabels through to heat-resistant transponders that can be used for several thousand cycles – are available for industrial applications.

SIMATIC RF600 can be used with SIMATIC controllers and PC/IT systems.

5

| MOBY U | RFID Software |

Overview

MOBY U is used to implement identification tasks with medium to high performance in the microwave frequency range (2.4 ... 2.4835 GHz) that require particularly high ranges.

MOBY U eliminates familiar sources of interference, such as reflections, electromagnetic interference and overreach, by means of appropriate technical measures.

Correspondingly constructed antennas ensure a homogeneous transmission field to guarantee reliable recognition of the transponders (MDS) even from unfavorable locations.

In addition, special coding procedures ensure that the data transmission functions without errors and the data integrity is guaranteed. To achieve this, methods and algorithms that have been tried and tested in mobile radio technology (GSM, UMTS) have been transferred to the identification technology.

Overview

SIMATIC RF-MANAGER

The SIMATIC RF-MANAGER is a software tool designed for fast and simple creation and commissioning of RFID applications as well as their smooth operation in combination with a higher-level enterprise system or SIMATIC S7 controllers.

The current RF-MANAGER version supports read/write devices of the RFID systems RF300 and RF600. Depending on the scope of the RFID application, various
software packages are available which differ in the number of supported readers (maximum 50).

SIMATIC Ident Identification Systems
Code reading systems

Introduction

■ Overview

Code reading systems –
Reading and verification of 1D/2D codes

For state-of-the-art production systems, tracing products and parts with machine-readable identification is a central requirement. A unique coding system permits the planning of each and every step of production for every part manufactured and changes within the production process or in the materials used. Direct marking of products also allows the implementation of specified legal requirements for tracing production batches throughout the production system.

What is Direct Part Marking (DPM)?

Direct Part Marking (DPM) indicates the application of a mark directly on the surface of a product without the use of a separate carrier material such as e.g. an adhesive label. This makes it possible to identify products in production and tracing them after delivery as well. So-called 2D codes have been used for years in a coding method that meets all user requirements. 2D codes consist of easy to implement, point-shaped basic elements. Laser and needle marking technologies are outstanding regarding durability, marking speed and material independence. Because of mechanical deformation, 2D codes can still be read using 2D read devices after multiple processing steps on metallic work pieces for example. 2D codes also provide the advantage of being able to encode data in more limited spaces than comparable barcodes or text.

The product range of Siemens code reading systems

Stationary code reading systems

SIMATIC MV440 and MV420 stationary code reading systems

The stationary code reading systems include compact basic and high-performance reading devices. The devices read various two-dimensional (2D) codes as well as one-dimensional (1D) barcodes. Many readers use data matrix print quality monitoring (verification) for process control.

SIMATIC MV440 can also read plain text (OCR stands for Optical Character Recognition)

Handheld reading systems

Handheld reading system SIMATIC HawkEye 40T

This handheld reading system is a powerful, high-resolution read device for either two-dimensional (2D) data matrix codes and/or one-dimensional bar codes (1D). The device can communicate with a host computer using RS232, USB, PS2 and Bluetooth depending on the selected version.

Overview (continued)

Verification systems

By using verification systems, the readability of marks is guaranteed throughout the entire production process regardless of any possible contamination or when using different read devices. Moreover, the marking can continue to be read after the production process throughout the lifespan of the product.

With the "Veri-Genius" verification license the SIMATIC MV440 can be expanded at any time by the verification functionality, in addition to reading 1D barcodes and 2D matrix codes. This license is supplied as a "Single License" on a USB flash drive and can be copied via the SIMATIC Automation License Manager (ALM) to the SIMATIC MV440 using a plug-in. The license is executable on any SIMATIC MV440 with firmware version 4.0 and higher.

Optical character recognition

With the OCR license "Text Genius" SIMATIC MV440 can also be used for text recognition in addition to reading 1D bar codes and 2D matrix codes. This is also known as OCR (Optical Character Recognition). It is also possible to read and compare plain text and machine-readable code in the same image field.

The license is supplied as a "Single License" on a USB stick and can be copied to the device with the SIMATIC Automation License Manager (ALM) using a plug-in. The license can be installed on a SIMATIC MV440 with firmware version 3.0 and higher.

Benefits

- Unique identification of products or product parts – Direct Part Marking is the key technology for tracing products
- Part-specific documentation of the production process
- Automation of the manufacturing process
- Verification for product liability cases (e.g. recall actions)

AS-Interface

AS-Interface
Introduction

Overview

AS-Interface is an open, international standard according to EN 50295 and IEC 62026-2 for process and field communication. Leading manufacturers of actuators and sensors all over the world support the AS-Interface. Interested companies are provided with the electrical and mechanical specifications by the AS-Interface Association.

AS-Interface is a single master system. For automation systems from Siemens there are communication processors (CPs) and network transitions (links) which control the process or field communication as masters, and actuators and sensors which are activated as AS-Interface slaves.

Benefits

get — Designed for Industry

A key feature of AS-Interface technology is the use of a shared two-conductor cable for data transmission and the distribution of auxiliary power to the sensors/actuators. A power supply unit which meets the requirements of the AS-Interface transmission method and has an external data decoupling module if required is used for the distribution of auxiliary power. The AS-Interface cable used for the wiring is mechanically coded and hence protected against polarity reversal and can be easily contacted by the insulation piercing method.

Elaborately wired control cables in the control cabinet and marshalling racks can be replaced by AS-Interface.

The AS-Interface cable can be connected to any points thanks to a specially developed cable and connection by the insulation piercing method.

With this concept you become extremely flexible and achieve high savings.

Application

Operating modes

Generally, master interfaces have the following operating modes:

I/O data exchange

In this operating mode the inputs and outputs of the binary AS-Interface slaves are read and written.

Analog value transmission

AS-Interface masters according to the AS-Interface Specification V2.1 or V3.0 support integrated analog value processing. This means that data exchange with analog AS-Interface slaves is just as easy as with digital slaves.

Command interface

In addition to I/O data exchange with binary and analog AS-Interface slaves the AS-Interface masters provide a number of other functions through the command interface.

Hence it is possible, for example, for slave addresses to be issued, parameter values transferred or diagnostics information read out from user programs.

Overview

System components

To implement the communication, a system installation has the following main components:

- Master interface modules for central control units such as SIMATIC S7, ET 200 M distributed peripherals, or network transitions from PROFIBUS/PROFINET to AS-Interface
- Power supply units, if required in combination with a data decoupling module for the power supply to the slaves
- AS-Interface shaped cables

- Network components such as repeaters and extension plugs (cannot be used for AS-i Power24V networks)
- Modules for connection of standard sensors/actuators
- Actuators and sensors with integrated AS-i slave
- Safety modules for transmitting safety-oriented data through AS-Interface
- Addressing units for setting the slave addresses during commissioning

Example of a configuration with the system components

Features

Standard	EN 50295 / IEC 62026-2	Maximum cycle time	5 ms with full expansion using standard addresses, 10 ms with full expansion using A/B addresses, profile-specific for Spec. 3.0 slaves
Topology	Line, star or tree structure (same as electrical wiring)	Number of stations per AS-Interface line	31 slaves acc. to AS-Interface Spec. V2.0; 62 slaves (A/B technology) acc. to AS-Interface Spec. V2.1 and V3.0, integrated analog value transmission
Transmission medium	Unshielded two-conductor cable (2 x 1.5 mm^2) for data and auxiliary power		
Connection methods	Contacting of the AS-Interface cable by insulation piercing method	Number of binary sensors and actuators	Max. 124 DI/124 DO according to Spec. V2.0; max. 248 DI/186 DO according to Spec. V2.1; max. 496 DI/496 DO according to Spec. V3.0
Maximum cable length	100 m without a repeater 200 m with extension plug 300 m with two repeaters connected in series 600 m with extension plugs and two repeaters connected in parallel Larger cable lengths are possible when additional repeaters are connected in parallel	Access control	Cyclic polling master slave method, cyclic data transfer by host (PLC, PC)
		Error safeguard	Identification and repetition of faulty message frames

AS-Interface
Introduction

AS-Interface specification
Specification 2.0, 2.1 and 3.0

◼ Overview

Scope of the AS-Interface specification

AS-Interface specification	Maximum number of slaves			Number of digital inputs	Number of digital outputs
	Digital	Analog	ASIsafe	DI	DO
Version 2.0	31	31	31	31 × 4 = 124	31 × 4 = 124
Version 2.1	62	31	31	62 × 4 = 248	62 × 3 = 186
Version 3.0	62	62	31	62 × 8 = 496	62 × 8 = 496

Basic data of AS-Interface Specification 2.0

- AS-Interface Specification 2.0 describes a fieldbus system with an AS-i master and up to 31 AS-i slaves.
- Each AS-i slave has up to 4 digital inputs and 4 digital outputs.
- With full expansion, the complete transmission of all input/output data requires max. 5 ms cycle time.

Expansions of AS-Interface Specification 2.1

AS-Interface Specification 2.1 enables the number of network stations to be doubled from 31 to 62 as follows:

- The standard slaves continue to occupy one AS-i address (1...31).
- Slaves with extended addressing divide an address into an A address (1A...31A) and a B address (1B...31B). Up to 62 A/B slaves can be connected accordingly to one AS-i network.
- Mixed operation of standard slaves and A/B slaves is possible without difficulty. The AS-i master identifies automatically which type of slave is connected. No special adjustments are required of the user.

Another function of the AS-Interface Specification V2.1 is the integrated analog value transmission function. Access to both analog values and digital values is possible without the need for any special function blocks.

Expansions of AS-Interface Specification 3.0

- AS-Interface Specification 3.0 enables the connection of a nearly 1000 digital inputs/outputs (profile S-7.A.A: 8DI/8DO as A/B slave).
- New profiles have also enabled the option of expanded addressing for analog slaves.
- Acceleration of analog value transmission through "Fast Analog Profile".
- Variable use of analog modules: Optional parameterization of resolution (12/14 bit) and 1 and 2-channel capability.
- Asynchronous serial protocol 100 baud or 50 baud, bidirectional.

AS-Interface masters

To be able to operate A/B slaves on an AS-Interface network you must use master modules that meet the minimum requirements of Specification 2.1.

The AS-i masters for S7-300 / ET 200M and all DP/AS-i links and IE/AS-i links comply with AS-Interface Specification 3.0 and support all new and previous slaves.

AS-Interface specification	Available masters
Version 2.1	CP 243-2 (S7-200)
Version 3.0	CP 343-2, 343-2P (S7-300 / ET 200M), DP/AS-i Link Advanced, DP/AS-i F-Link, DP/AS-Interface Link 20E, IE/AS-i Link PN IO

The AS-Interface specification relevant for the respective slave is noted in the Selection and ordering data.

The exact slave profile can be found in the system manual for AS-Interface.

Communication cycle

AS-Interface specification	Maximum cycle time (digital signals)
Version 2.0	5 ms
Version 2.1	5 ms with 31 slaves 10 ms with 62 slaves
Version 3.0	5 ms with 31 slaves 10 ms with 62 slaves, supplementary, up to 20 ms with A/B slaves using 4DI/4DO, up to 40 ms with A/B slaves using 8DI/8DO.

Each address is queried in max. 5 ms cycle time. If two A/B slaves are operated on one basic address (e.g. 12A and 12B), a maximum 10 ms will be required for updating the data of both slaves.

Whether an AS-Interface slave is a standard slave or an A/B slave can be seen in the section "Selection and ordering data" or the system manual for AS-Interface.
All slave types can be mixed and used on a single AS-Interface network.

6

Overview

Symbol for AS-i Power24V

Parallel wiring often dominates still, particularly in applications with very few I/Os. Although AS-Interface is similarly well suited for small applications, its use is often prevented by the cost of the 30 V AS-Interface power supply unit which is required in addition.
Through the expansion of AS-Interface with AS-i Power24V and the resulting possibility of using existing standard 24 V DC power supply units in AS-i networks, AS-Interface is now also attractive for applications with a very tight budget.

Data and power in standard AS-Interface networks up to now

One of the great advantages of AS-Interface is the ability to convey not only data but also the power needed for the connected slaves and sensors over the same unshielded two-conductor cable. This is owed to the service-proven AS-Interface power supply units which provide integrated data decoupling as well as overload and short-circuit protection and integrated ground fault monitoring.

The new technology

Through the expansion of AS-Interface with AS-i Power24V it is now also possible to use 24 V standard power supply units in AS-i networks. The communication technology of AS-Interface works at the same high level of quality with an operating voltage of both 30 V DC and 24 V DC.

Key data of AS-i Power24V	
Number of slaves	Up to 62 standard slaves and up to 31 safe slaves
Topology	Any
Range	Up to 50 m
Components	• 24V power supply unit with little residual ripple
	• AS-i Power24V-capable data decoupling with integrated ground-fault detection
	• AS-i Power24V-capable masters, slaves and components

Requirements for operation of an AS-i Power24V network

- The maximum range of 50 m must be observed in order to reach slaves and sensors with a sufficient level of voltage (at least 20 V).

- The power supply units must comply with the PELV Standard (Protective Extra Low Voltage) and have a residual ripple of < 250 mVpp. We recommend power supply units from the SITOP range, see Catalog IC 10.

- When used in conjunction with standard 24 V power supply units, each AS-i network requires Power24V-capable data decoupling with adapted ground fault detection.

- For reliable operation of an AS-i network with 24 V voltage it is important that the masters, slaves and other components are approved for AS-i Power24V. AS-i Power24V-capable AS-i components can also be used without restriction in standard 30 V AS-i networks.

- The use of repeaters or extension plugs in AS-i Power24V networks is not permitted.

Benefits

AS-i Power24V networks incur no additional costs for an AS-Interface power supply unit because an already existing 24 V power supply unit can be used. This brings the user several benefits:

- The level of standardization of very small applications can be increased further.

- The additional advantages of a modern communication system in terms of commissioning, maintenance and diagnostics can be fully exploited.

Application

Construction of an AS-i Power24V network

Construction of an AS-i Power24V network with an AS-Interface S22.5 data decoupling module (simple network)

More information

A complete overview of AS-i Power24V-capable units currently available from Siemens can be found at
http://support.automation.siemens.com/WW/view/en/42806066

Details of AS-i Power24V can be found in the
AS-Interface System Manual at
http://support.automation.siemens.com/WW/view/en/26250840

AS-Interface
ASIsafe

Overview

Secure communication and standard communication on AS-Interface

Safety is included

The ASIsafe concept supports the integration of safety-related components, such as EMERGENCY-STOP switches, protective door switches or safety light arrays, in the AS-Interface network. These are fully compatible with the familiar AS-Interface components (masters, slaves, power supplies, repeaters, etc.) in accordance with IEC 62026 and are operated in conjunction with them on the yellow AS-Interface cable.

A failsafe controller or a special master is not required. The master regards safety slaves like all other slaves and receives the safety data solely for information purposes. All existing AS-Interface networks can thus be expanded.
ASIsafe makes sure that a maximum response time of 40 ms can be achieved. This is the time between the signal being applied to the input of the safe slave and the output on the safety monitor being switched off. With distributed disconnection through a safe AS-i output, the response time is extended by the time (30 ms) which the safe AS-i output requires in addition to the disconnection to a total of 70 ms (worst case).

Tested safety

The system was tested and approved by TÜV (Germany), NRTL (USA) and INRS (France). The transmission procedure for safety-oriented signals is configured for implementing applications up to Category 4 according to EN 954-1, up to PL e according to EN ISO 13849-1 and up to SIL 3 according to IEC 62061/IEC 61508.

Design

The design of the safety systems is identical to the wiring of AS-Interface as it is known today.

The family of safe AS-Interface products includes the safety monitor which monitors or disconnects the safe stations. The range of safe stations comprises the safety modules and the safety-related sensors with integrated interface. Sensors, monitors and safe AS-i outputs can be connected to any points of the AS-Interface network. Also, several monitors can be used on one network.

The components of ASIsafe

Standard PLC and standard AS-i master:
Central installation at the PLC and distributed installation using DP-AS-i Links is possible.

Safety monitor:
The safety monitor evaluates all safe inputs on the AS-i bus and ensures safe disconnection.

Safe input slave:
Safe signals are made available through the safe slaves and e. g. to the safety monitor for evaluation.

Safe AS-i outputs:
The disconnection signal from e. g. the safety monitor can be used via ASIsafe for the safety-oriented disconnection of distributed safe AS-i outputs.

— Signal evaluation of safe input slave/ safety monitor/ or safe disconnect signal to the safe AS-i output

— AS-Interface cable

- - - Extended ASIsafe diagnostics (through regular I/O transfer)

The ASIsafe components and their signal flows

■ Overview (continued)

Function

Like the standard stations, the safe stations send their information to the master after master calls.

The safety monitor monitors this transmission from the safe stations to the master and switches to the safe state or sends a disconnect signal to one or more distributed safe AS-i outputs which switch in turn to the safe state.

The safety monitor provides OR logic, AND logic, timer functions, buffer storage, etc.

Software

With the ASIMON configuration software you can configure safety-oriented applications and transfer them into the monitor. The configuration comprises the input signals of the safe stations and the internal functions of the safety monitor.

The software also enables online diagnostics.

Integration

The existing infrastructure such as the master and the power supply unit can be used as before for integrating the safety systems in AS-Interface. For the safety systems the safety monitor is integrated as monitoring element and the safe stations as interface between the safe sensors and the system. The safe sensors can be used as before.

A detailed diagnosis of all parameterized modules of the safety monitor can be obtained using the PLC. The STEP 7 function blocks for the S7-200 and S7-300/400 are available on the internet at
http://support.automation.siemens.com/WW/view/en/25239870/130000

In addition an AS-i address should be set for the safety monitor via the configuration software. Evaluation is performed by means of function blocks in the PLC. With the aid of prefabricated WinCC flexible function units this evaluation can be visualized across the system on the existing SIMATIC HMI devices.

Diagnostics interface for ASIsafe components via S7-200 or S7-300

■ Benefits

- No failsafe PLC or special master is required for the ASIsafe Solution local (safety monitor)
- Alternatively integration in SIMATIC / SINUMERIK safety architectures with the aid of DP/AS-i F-Link (ASIsafe Solution PROFIsafe)
- Simple system structure thanks to standardized AS-Interface technique
- Safety-related and standard data on the same bus
- Existing systems can be expanded quickly and easily
- Optimum integration in TIA (Safety Diagnostics) and Safety Integrated
- Safe signals can be combined in groups
- Inclusion of the safety signals in the plant diagnostics, also on existing HMI panels
- Approved to Category 4 according to EN 954-1 or PL e according to EN ISO 13849-1 or SIL 3 according to IEC 61508
- ASIsafe is certified by TÜV (Germany), NRTL (USA) and INRS (France)

■ Application

Integrated safety technology in the AS-Interface system is used wherever EMERGENCY-STOP pushbuttons, protective door interlocks, stop Category 0 and 1, two-hand operator controls and light arrays now installed.

■ More information

More information and circuit examples for safety systems with AS-Interface Safety Monitor and DP/AS-i F-Link can be found on the Internet at
http://support.automation.siemens.com/WW/view/en/24509484

6

AS-Interface
ASIsafe

AS-Interface safety monitors

Overview

Safety monitor with screw terminals (removable terminals)

The safety monitor is the centerpiece of ASIsafe Solution local. It enables safety-orientated responding to signals from the ASIsafe (input) slaves on the same AS-i network and has 1-2 enabling circuits. A safe application is configured using a PC. Various application-specific operating modes can be selected for this. They include, for example, an EMERGENCY-STOP function, door tumbler and selection of stop Category 0 or Category 1.

To be able to make full use of the AS-Interface diagnostics options, the monitor can also be operated with an AS interface address if required. With the aid of the diagnostics module for STEP 7, which is included on the ASIsafe CD, the full diagnostics spectrum can be processed further in the higher-level PLC.

The AS-Interface safety monitor is currently offered in the latest Version 3 (Firmware V3.x) and is available in three expansion levels.

Both basic/expanded expansion levels are available with one or two-channeled configured enabling circuits.

The expanded safety monitor is also available as a version with integrated safe slave which can be used for the control of a safe AS-i output or for safe coupling of a switch signal on another safety monitor or F-Link.

The safety monitor is used in an AS-Interface bus system to monitor protective devices, e. g. protective doors, EMERGENCY-STOP switches, etc.

The safety monitor can be used up to Category 4 according to EN 954-1, to PL e according to EN ISO 13849-1 and to SIL 3 according to IEC 62061/IEC 61508.

Note:

Depending on the choice of safety components used, the complete safety system may also be classified in a lower safety category.

The safety monitor is mounted on the standard mounting rail. Disassembly from the standard mounting rail is quick and easy and requires no tools. With an additional accessory (push-in lugs), the safety monitor can also be screwed on.

Application

The safety monitor acts as a "bus-based safety relay". It provides a user-friendly introduction to safety-orientated communication over fieldbuses thanks to its simple configuration using the graphic PC software ASIMON. The standard infrastructure of the AS-i network (AS-i master under standard PLC, AS-i power supply unit) can still be used without restriction.

The monitor comes in three expansion levels:

- Basic safety monitor
  with starter set of modules and basic functionality
- Expanded safety monitor with expanded features and functionality
- The expanded safety monitor is also available as a version with integrated safe slave which can be used for the control of a distributed safe AS-i output or for safe coupling of a switch signal on another safety monitor or F-Link.

Basic safety monitor versus expanded safety monitor

	Basic	Expanded
Number of monitoring modules	32	48
Number of OR gates (inputs)	2	6
Number of AND gates (inputs)	--	6
Wildcards for monitoring modules	✓	✓
Deactivating of monitoring modules	✓	✓
Fault release	✓	✓
Diagnostics hold	✓	✓
A/B slaves for acknowledgment	✓	✓
Safe time functions	--	✓
"Button" function	--	✓
Debouncing of contacts	--	✓
Filtering out of brief disconnections	--	✓ (as of Version 3)
Control of safe AS-i output/safe coupling	--	✓ (in version with integrated safe slave)

✓ Available

-- Not available

Number of monitoring modules

The number of devices which the safety monitor can process is increased with the expanded safety monitor from 32 to 48. Applications of greater complexity and size can thus be simulated in the safety monitor.

Logic OR operation

At the logic operation level two elements can be linked by OR operations in the basic version and up to six in the expanded version.

Logic AND operation

In addition to the standard AND operation in the main path of an enabling circuit, an AND operation can also be inserted in an OR operation on the expanded safety monitor. More than two elements can be linked in this AND.

6

▌ **Application** (continued)

Features of the basic safety monitor

- Wildcards and deactivating of monitoring modules
  Wildcards are available for the configuration. They are integrated in the configuration and diagnostics and can be easily activated if required. User-friendly configuring is thus possible even when system configurations change.

- Fault release:
  If a module detects a fault, the AS-Interface safety monitor goes into fault status. A differentiated fault release (reset) is now possible for this scenario. The fault release can be activated by an AS-Interface standard slave, e. g. a pushbutton, and is effective only on module level. The great advantage of this is that the entire safety monitor is no longer reset but only the module which is locked in the fault.

- Diagnostics hold:
  Disconnections can be "frozen" until an acknowledgment comes through a standard slave. This function provides valuable help in the event of short-time causes of disconnection.

- Also from Version 3 upwards:
  The standard output data bits of safe input slaves can be processed for acknowledgment, fault release and other non-safety-oriented signals.

Additional features of the expanded safety monitor

The following additional features are provided by only the expanded safety monitor:

- Safe time functions:
  Timers with the following functions are available:
  - ON-delay
  - OFF-delay and
  - Pulse

- "Button" function:
  Additional acknowledgment option for restarting the system using an additional button. The button function can be assigned to any input or output signal of a standard slave through configuration in the ASIMON software.

- Debouncing of contacts:
  For debouncing the contacts it is possible to set a bounce time after which a system restart takes place.

- Also from Version 3 upwards:
  Filtering out of brief single-channel interruptions in the sensor circuit. A tolerance time can be set during which the brief opening of a safety-oriented input contact is ignored in order to increase plant availability.

Additional features of the expanded safety monitor with integrated safe slave

This new safety monitor type offers the additional features of the expanded safety monitor plus the following features:

- Filtering out of brief single-channel interruptions in the sensor circuit.

- Actuating a safe distributed actuator (safe output module of e.g. safe valves or motor starters) in parallel to the 2nd enabling circuit.

- Alternatively: Use as a "safe coupler" between two ASIsafe networks. A safe input signal on network 1 can thus act on an enabling circuit of network 2. A detour via a hard-wired safe input module on network 2 is not required in this case.

Configuration software ASIMON V3: New features

- Multi-window system

- Creation of the safety logic in graphic function diagram form, with changeover to former tree presentation possible

- No "preprocessing" of the safety logic

- Management of user-specific modules

- Downward compatibility:
  - Existing ASIMON V2 projects can be loaded
  - Can also be used on all former versions of the safety monitor
    – with the corresponding scope of functions

- Graphic printout of the safety logic

- Easier system start-up:
  - Teaching the code sequences of safe AS-i Slaves step-by-step
  - Manual input of code sequences also possible in addition
  - Selectable number of simulated slaves

- Simpler diagnostics using AS-Interface through assignment of a diagnostics index to the software function block

- Signaling the switching state of the signaling and relay outputs to higher-level PLCs using a simulated AS-Interface slave

- New functions for filtering out brief interruptions and for controlling a safe AS-i output or for safe coupling of two AS-i networks

Interface of the configuration software ASIMON V3

■ **Overview**

AS-Interface safety modules: K45F (left), K20F (center) and S22.5F (right)

S45F SlimLine module, safe AS-i output

Safety modules for AS-Interface (ASIsafe modules) are available for field use in degree of protection IP67 (K20F and K45F compact modules) and for the control cabinet (S22.5F SlimLine modules) in degree of protection IP20.

A very compact module with an optimum price /performance ratio is thus available for very application.

All modules for the connection of (mechanical) switches and safety sensors with contacts feature crossover monitoring of the connected sensor lead. On versions for the connection of solid-state switches and safety sensors (e. g. light arrays) the crossover monitoring must be performed by the sensor.

Following modules are available for selection:

K20F compact safety modules for operation in the field

Being only 20 mm wide, the K20F module is particularly well suited for applications where modules need to be arranged in an extremely confined space. The K20F modules are connected to the AS-Interface with a round cable with M12 cable box instead of with the AS-Interface flat cable. This enables extremely compact installation. The flexibility of the round cable means that it can also be used on moving machine parts without any problems. The K20 modules are also ideal for such applications as their non-encapsulated design makes them particularly light in weight.

K45F compact safety modules for operation in the field

The platform of the K45F modules covers the following variations:

- Connection of ("mechanical") switches/safety sensors with contacts:
  - K45F 2F-DI: Two safety-oriented inputs in operation up to Category 2 according to EN ISO 13849-1. If Category 4 is required, a two-channel input is available on the module.
  - K45F 2F-DI/2DO: There are also two standard outputs in addition to the safe inputs. Supplied from the yellow AS-i cable
  - K45F 2F-DI/2DO U_{aux}: same as K45F 2F-DI/2DO, but supplied from the black 24 V DC cable
  - K45F 4F-DI: four safety-oriented inputs in operation up to Category 2, two for Category 4. Extremely compact double slave (uses two full AS-i addresses).
- Connection of solid-state switches/safety sensors (non-contact protective devices, BWS):
  - K45F LS (light sensor): Safe input module for the connection of electronic safety sensors with testing semiconductor outputs (OSSD)
    In particular non-contact protective devices (BWS) such as active, optoelectronic light arrays and light curtains for Type 2 and Type 4 according to IEC/EN 61496
    Transmitters as well as receivers are supplied with power from the yellow AS-i cable. Matching sensor cables and optionally a separate transmitter supply module are available as accessories.

S22.5F SlimLine safety modules for operation in control cabinets and local control cabinets

The S22.5F SlimLine safety module has two safety inputs. The safe connection of signals to ASIsafe networks in the control cabinet is also possible therefore.
For operation up to Category 2, both inputs can be assigned separately; if Category 4 is required, a two-channel input is available on the module.

In addition there are two S22.5F module versions which have two standard outputs in addition to the two safety inputs; power is supplied either from only the yellow AS-Interface cable or as auxiliary voltage from the black 24 V DC cable.

S45F SlimLine safety modules with safe outputs for the safe distributed disconnection of actuators

With the safe SlimLine-Module S45F, the shutdown signal, for example from the safety monitor, can be used through the ASIsafe for distributed safety-oriented deactivation.

To this end, the module has a dual-channel relay output with which an enabling circuit up to safety category 4 and Performance Level e according to EN ISO 13849-1 and SIL 3 according to EN 62061 / IEC 61508 can be deactivated safely. The response time for the entire system (safety monitor, S45F module, etc.) from the moment of the disconnect request to the actual disconnection is max. 70 ms.

As an additional possibility the module offers normal switching of the output using an AS-i standard output bit.

The module has 3 digital inputs and 2 digital outputs for the additional connection of sensors and actuators. These can be used, inter alia, for the necessary monitoring of the downstream contactors of the feedback circuit.

AS-Interface
ASIsafe

3SF1 position switches

■ Overview

The 3SF1 position switches with safety-oriented communication can be directly connected using the AS-Interface bus system. The safety functions no longer have to be conventionally wired up.

With the 3SF1 position switches the ASIsafe electronics are integrated in the switch enclosure.

Examples of selection options in the modular system

Modular system

The 3SF1 1.4 and 3SF1 2.4 position switches are built as a modular system, which consists of the basic switch in different versions and a drive, which must be ordered separately. Thanks to the modular design of the switch the end user can select the right solution for his application from numerous versions and install it himself in a very short time.

Design

The 3SF1 switches are available in four different enclosure sizes:
- Plastic and metal enclosures according to EN 50047, 31 mm wide, with M12 plug
- Metal enclosures according to EN 50041, 40 mm wide, with M12 plug
- Plastic enclosures, 50 mm wide, with M12 plug and M12 socket
- Metal enclosures, 56 mm wide, with M12 plug and M12 socket

Display

The switches have a status display with three LEDs:
- LED 1 (yellow):   F-IN1
- LED 2 (yellow):   F-IN2
- LED 3 (green/red): AS-i/FAULT

Connection

Connection to the AS-Interface is connected to the yellow AS-Interface bus cable by means of a 4-pole M12 plug (plastic version).

The wide enclosures (50 or 56 mm) also have an M12 socket for connecting a second position switch. Category 4 according to EN 954-1 is thus achieved.

Benefits

The new generation of 3SF1 position switches offers:
- ASIsafe Electronics integrated in the enclosure, with low power consumption < 60 mA
- An extensive range of actuators
- Status display with three LEDs

Operating conditions

With the standard position switches, mechanical positions of moved machine parts are converted into electrical signals. Through their modular and uniform design and large number of versions, the devices can meet practically all requirements in industry.

Devices are available with enclosure versions to suit the particular ambient conditions. Different control tasks can be performed with the best contact blocks suited for the particular purpose. And many different actuator versions are available to match the mechanical configuration of the moved machined parts. Dimensions, fixing points and characteristics are largely in accordance with the EN 50041 or EN 50047 standards.

The devices are suitable for use in any climate.

Standards

The switches comply with the standards IEC 60947-1 (Low-Voltage Switchgear and Controlgear, General) and IEC 60947-5-1 (Electromechanical Control Circuit Devices).

The mechanical design of the switch corresponds to the requirements of the failsafe principle according to EN 1088.

Approvals

AS-Interface according to EN 50295 and IEC 62026-2.

With a 3SF1 position switch it is possible to achieve category 2 according to ISO 13849-1 (EN 954-1) or SIL 1 according to IEC 61508.

Categories 3 or 4 according to ISO 13849-1 (EN 954-1) or SIL 2 or 3 according to IEC 61508 can be achieved by using a second 3SE5 position switch.

The 3SF1 position switches are approved according to UL 508, UL 50 and UL 746-C.

Selection and ordering data

Modular system

For the ASIsafe version of the position switch, the basic switch
and actuator must be ordered separately.

1 or 2 contacts · 3 LEDs · Degree of protection IP65 (31 mm) or IP66/IP67 (50 mm) · M12 plug

[1] Can be clinch mounted (turned through 180°, rear of lever).

■ **Overview**

The 3SF1 position switches with safety-oriented communication can be directly connected using the AS-Interface bus system. The safety functions no longer have to be conventionally wired up.

With the 3SF1 position switches the ASIsafe electronics are integrated in the switch enclosure.

3SF1 position switches with separate actuator and with integrated ASIsafe electronics

3SF1 position switches with separate actuator have the same enclosures as the standard switches.

Operation

The actuator head is included in the scope of supply. For actuation from four directions it can be adjusted through 4 × 90°. The switches can also be approached from above.

The actuators are not included in the scope of supply of the position switch and must be ordered separately from a choice of six versions to suit the application.

The actuator is encoded. Simple overruling by hand or auxiliary devices is impossible.

A high-grade steel blocking insert for attaching up to eight padlocks is available for even more safety.

A rubber cap to protect the metal enclosure from contamination is available for operation in dusty environments.

Display

The switches have a status display with three LEDs:
- LED 1 (yellow):   F-IN1
- LED 2 (yellow):   F-IN2
- LED 3 (green/red): AS-i/FAULT

Connection

Connection to the AS-Interface is by means of a 4-pole M12 plug (plastic version) connected to the yellow AS-Interface bus cable.

The wide enclosures (50 or 56 mm) also have an M12 socket for connecting a second position switch. Category 4 according to EN 954-1 is thus achieved.

Benefits

The new generation of 3SF1 position switches with separate actuator offers:
- ASIsafe Electronics integrated in the enclosure, with low power consumption < 60 mA
- An extensive range of actuators
- Status display with three LEDs

Operating conditions

Position switches with separate actuator are used where the position of doors, covers or protective grills must be monitored for safety reasons.

The position switch can only be operated with the matching coded actuator. Simple overruling by hand or auxiliary devices is impossible.

Devices are available with enclosure versions to suit the particular ambient conditions. Different control tasks can be performed with the best contact blocks suited for the particular purpose. Dimensions, fixing points of the enclosure are in accordance with EN 50041 or EN 50047 standards.

The devices are suitable for use in any climate.

Standards

The switches comply with the standards IEC 60947-1 (Low-Voltage Switchgear and Controlgear, General) and IEC 60947-5-1 (Electromechanical Control Circuit Devices).

The mechanical design of the switch corresponds to the requirements of the failsafe principle according to EN 1088.

Approvals

AS-Interface according to EN 50295 and IEC 62026-2.

Category 3 acc. to ISO 13849-1 (EN 954-1) or SIL 2 acc. to IEC 61508 can be attained using a 3SF1 position switch.

Category 4 according to ISO 13849-1 (EN 954-1) or SIL 3 according to IEC 61508 can be achieved by using a second 3SE5 position switch.

The 3SF1 position switches are approved according to UL 508, UL 50 and UL 746-C.

➔ Actuator can be used in safety circuits.

[1] Not suitable for safety switches with interlocking.

■ Overview

The 3SF1 position switches with safety-oriented communication can be directly connected using the AS-Interface bus system. The safety functions no longer have to be conventionally wired up.

With the 3SF1 position switches the ASIsafe electronics are integrated in the switch enclosure.

3SF1 position switch with solenoid interlocking and with integrated ASIsafe electronics

Operation

The actuator head is included in the scope of supply. For actuation from four directions it can be adjusted through 4 × 90°. The switches can also be approached from above.

The actuator is not included in the scope of supply for the position switch and must be ordered separately, with a choice of eight variations depending on application.

The actuator is encoded. Simple overruling by hand or auxiliary devices is impossible.

A high-grade steel blocking insert for attaching up to eight padlocks is available for even more safety.

A rubber cap to protect the enclosure from contamination is available for operation in dusty environments.

Solenoid interlocking

There are two versions for locking the actuator:
- Spring-actuated lock (closed-circuit principle) with various release mechanisms
- Magnetic field lock (open-circuit principle)

Display

The switches have a status display with four LEDs:
- LED 1 (green): AS-i
- LED 2 (red): FAULT
- LED 3 (yellow): F-IN1
- LED 4 (yellow): F-IN2

Connection

Connection to the AS-Interface is by means of a 4-pole M12 plug (plastic version) connected to the yellow AS-Interface bus cable (no additional supply of auxiliary power is required thanks to the low current consumption of the solenoid of max. 170 mA).

Benefits

The new generation of 3SF1 3 position switches with solenoid interlocking offers:
- More safety through higher locking forces:
  - 1300 N for the plastic version
  - 2600 N for the metal version
- Various release mechanisms:
  lock release, escape release and emergency release
- ASIsafe electronics integrated in the enclosure; connected through 4-pole M12 plug
- Current consumption of the solenoid max. 170 mA
- Two contact blocks as standard equipment, hence fewer versions needed
- Same dimensions for all enclosure versions: Plastic, metal
- An extensive range of actuators
- Status display with four LEDs

Operating conditions

The position switches with solenoid interlocking are exceptional safety-related devices which prevent an unforeseen or intentional opening of protective doors, protective grills or other covers as long as a dangerous situation is present (i.e. follow-on motion of the switched off machine).

The safety position switches with solenoid interlocking have the following functions:
- Enabling the machine or process with closed and locked protective device
- Locking the machine or process with opened protective device
- Position monitoring of the protective device and solenoid interlocking

Standards

The switches comply with the standards IEC 60947-1 (Low-Voltage Switchgear and Controlgear, General) and IEC 60947-5-1 (Electromechanical Control Circuit Devices).

The mechanical design of the switch corresponds to the requirements of the failsafe principle according to EN 1088.

Approvals

AS-Interface according to EN 50295 and IEC 62026-2.

The switches are approved for use with locking devices according to EN 1088 and EN 292, Parts 1 and 2.

The 3SF5 3 position switches with interlocking have a VDE test marking.

With a 3SF1 3 position switch it is possible to achieve category 3 according to ISO 13849-1 (EN 954-1) or SIL 2 according to IEC 61508.

Category 4 according to ISO 13849-1 (EN 954-1) or SIL 3 according to IEC 61508 can be achieved by using a second 3SE5 position switch.

The 3SF1 position switches are approved according to UL 508, UL 50 and UL 746-C.

Comparison of versions

Safety level

The new 3SF1 324-1S.21-1BA4 safety position switches are also suitable for several interlocks for protective doors – for secure diagnosis and fast ability to reclose the system.

They feature:

- feedback from the solenoid and
- the doors do <u>not</u> need to be opened after the magnet is released.

With AS-i safety monitor or in DP/AS-i F-Link it is possible to achieve SIL 2 according to IEC 61508 or PL d according to ISO 13849-1.

Version	Contacts	Attainable safety level	Diagnostics	Reclose condition after the release of the magnet
	Actuator / magnet		Magnet feedback	(depends on the type of evaluation)

AS-Interface
ASIsafe

3SF1 hinge switches
Plastic enclosures

Overview

The 3SF1 hinge switches with safety-oriented communication can be directly connected using the AS-Interface bus system. The safety functions no longer have to be conventionally wired up.

With the 3SF1 position switches the ASIsafe electronics are integrated in the switch enclosure.

The hinge switches are provided for mounting on hinges. There are two actuator versions here:
• Hollow shaft, inner diameter 8 mm, outer 12 mm
• Solid shaft, diameter 10 mm

For the ASIsafe version of the hinge switch, the basic switch and twist actuator must be ordered separately. The basic switches correspond to the position switches of the standard version (only use versions with snap-action contacts).

The standards and approvals correspond to position switches 3SF1 (see page 6/14).

⊖ Positive opening according to IEC 60947-5-1, Appendix K.

Overview

The 3SF1 hinge switches with safety-oriented communication can be directly connected using the AS-Interface bus system. The safety functions no longer have to be conventionally wired up.

With the 3SF1 position switches the ASIsafe electronics are integrated in the switch enclosure.

The hinge switches are provided for mounting on hinges. There are two actuator versions here:
• Hollow shaft, inner diameter 8 mm, outer 12 mm
• Solid shaft, diameter 10 mm

For the ASIsafe version of the hinge switch, the basic switch and twist actuator must be ordered separately. The basic switches correspond to the position switches of the standard version (only use versions with snap-action contacts).

The standards and approvals correspond to position switches 3SF1 (see page 6/14).

AS-Interface
ASIsafe

3SF2 cable-operated switches for AS-Interface

Overview

SIRIUS cable-operated switches are used for monitoring or for EMERGENCY-STOP devices on particularly endangered system sections.

AS-Interface cable-operated switches can be directly connected via the bus system AS-Interface with safety-oriented communication.

The safety functions no longer have to be conventionally wired up.

As the effective range of a cable-operated switch is only limited by the length of the trip-wire, large systems can also be protected.

Standards

The switches with positive latching are suitable for operation in EMERGENCY-STOP devices in according to ISO 13850. They can be used up to category 4 acc. to ISO 13849-1 (EN 954-1) or SIL 3 acc. to IEC 61508.

➔ Positive opening according to IEC 60947-5-1, Appendix K.

Overview

EMERGENCY-STOP control devices can now be directly connected via the standard AS-Interface with safety-oriented communication. This only applies for the SIRIUS 3SB3 EMERGENCY-STOP mushroom pushbutton for front panel mounting and for mounting into an enclosure.

AS-Interface EMERGENCY-STOP enclosures

The enclosure is delivered fully equipped and wired up. It contains:

- EMERGENCY-STOP SIRIUS 3SB3 mushroom pushbutton with compulsory latching acc. to ISO 13850 and rotate-to-unlatch mechanism
- Contact blocks with two NC contacts
- F slave with 2 safe inputs
- Inscription labels

The plastic enclosures have a plastic EMERGENCY-STOP mushroom pushbutton, the metal enclosures have a metal EMERGENCY-STOP mushroom pushbutton.

The plastic enclosures are designed with a connecting terminal for the AS-Interface shaped cable (the cable is contacted using insulation piercing method and run past the outside of the enclosure). For the metal enclosures, the AS-Interface shaped cable (or round cable) is routed into the enclosure.

The enclosures can also be delivered with a M12 plug.

AS-Interface
ASIsafe

**AS-Interface F adapters
for EMERGENCY-STOP devices**

■ **Overview**

The AS-Interface F adapter is used to connect an EMERGENCY-STOP device according to ISO 13850 from the 3SB3 series to the AS-Interface bus system. The F adapter is suitable for control devices with mounting on front plates.

The F adapter has a safe AS-Interface 2I slave and is snapped from behind onto the EMERGENCY-STOP mushroom pushbutton In the 2I/1O expanded version, an output is also available for actuating an indicator light with LED.

Depending on the version, screw terminals or spring-type terminals or the insulation piercing method are used for connecting to the AS-Interface bus cable. Addressing is performed using the AS-Interface connection or the integrated addressing socket.

Safety category 4 (SIL 3) is achieved with the adapter.

Overview

CP 243-2

The CP 243-2 is the AS-Interface master for the SIMATIC S7-200 and has the following features:

- Connection of up to 62 AS-Interface slaves
- Integrated analog value transmission (Analog Profiles 7.3 and 7.4)
- Supports all AS-Interface master functions according to the extended AS-Interface specification V2.1
- Indication of the operating state and readiness for operation of connected slaves by means of LEDs in the front panel
- Fault indications (e. g. AS-Interface voltage fault, configuration fault) by means of LEDs in the front panel
- Compact enclosure in the design of the SIMATIC S7-200

Design

The CP 243-2 is connected like an expansion module to the S7-200. It has:

- Two screw terminals for direct connection of the AS-Interface cable
- LEDs in the front panel for indicating the operating state and functional readiness of all connected slaves
- Two pushbuttons for indicating the status information of the slaves, for switching over the operating state and for adopting the existing ACTUAL configuration as the DESIRED configuration.

Function

The CP 243-2 supports all specified functions of the extended AS-Interface Specification V2.1.

In the process image of the S7-200 the CP 243-2 occupies one digital input byte (status byte), one digital output byte (control byte), and 8 analog input and 8 analog output words. The CP 243-2 thus occupies two (logic) slots. The operating mode of the CP 243-2 can be set with the status byte and the control byte using the user program. Depending on the operating mode, the CP 243-2 saves either the digital or analog I/O data of the AS-Interface slaves or diagnostic values in the analog address area of the S7-200, or it enables master calls (e.g. re-addressing of the slaves).

Configuration

All connected AS-Interface slaves are configured at the press of a button. No further configuration of the CP is required.

Benefits

- More flexibility and versatility in the use of SIMATIC S7-200 as the result of the distinct increase in the number of digital and analog inputs/outputs available

- Shorter start-up times through simple configuration at the press of a button
- Reduction of standstill and servicing times in the event of a fault thanks to the LED indicators
- Status of the CP
  - Indication of all the slaves connected and their readiness for operation
  - Monitoring of the AS-Interface mains voltage

Application

The CP 243-2 is the AS-Interface master connection for the 22x CPUs of the SIMATIC S7-200. Through connection to AS-Interface the number of inputs and outputs available for S7-200 is greatly increased (max. 248 DI / 186 DO on the AS-Interface per CP).

Analog values (per CP a maximum of 31 standard analog slaves with up to 4 channels each) also become available on the AS-Interface for the S7-200 thanks to the integrated analog value processing. On the S7-200, up to two CP 243-2 communication processors can be operated simultaneously.

AS-Interface
Masters

Overview

CP 343-2P / CP 343-2

The CP 343-2P is the AS-Interface master for the SIMATIC S7-300 and the ET 200M distributed I/O station, with user-friendly parameterizing options.

The CP 343-2 is the basic version of the same module.

The CP 343-2P / CP 343-2 has the following features:

- Connection of up to 62 AS-Interface slaves
- Integrated analog value transmission (all analog profiles)
- Supports all AS-Interface master functions according to the AS-Interface Specification V3.0
- Status displays of operating states and indication of the readiness for operation of connected slaves by means of LEDs in the front panel
- Fault indication (e.g. AS-Interface voltage fault, configuration fault) by means of LEDs in the front panel
- Compact enclosure in the design of the SIMATIC S7-300
- Suitable for AS-i Power24V (product version 2 and higher / firmware version 3.1) and standard AS-i (30 V)
- Extra with the CP 343-2P: Supports detailed configuration of the AS-Interface-network with STEP 7 V5.2 and higher

Design

The CP 343-2P / CP 343-2 is connected like an I/O module to the S7-300. It has:

- Two terminal connections for direct connection of the AS-Interface cable
- LEDs in the front panel for indicating the operating state and the readiness for operation of all connected and activated slaves
- Pushbuttons for switching over the master operating state and for adopting the existing ACTUAL configuration of the AS-i slave as the DESIRED configuration

Function

The CP 343-2P / CP 343-2 supports all specified functions of the extended AS-Interface Specification V3.0.

The CP 343-2P / CP 343-2 occupies 16 bytes each in the I/O address area of the SIMATIC S7-300. The digital I/O data of the standard slaves and A slaves are saved in this area. The digital I/O data of the B slaves and the analog I/O data can be accessed with the S7 system functions.

If required, master calls can be performed with the command interface FC ASI_3422, e. g. read/write parameters, read/write configuration. The FC including a STEP7 sample program can be downloaded from the Internet at:
http://support.automation.siemens.com/WW/view/en/5581657

Configuration

All connected AS-Interface slaves are configured at the press of a button. No further configuration of the CP is required.

Additional features of the CP 343-2P

The CP 343-2P also supports configuring of the AS-Interface network with STEP 7 V5.2 and higher. Specifying the AS-i configuration in HW-Config facilitates the setting of slave parameters and documentation of the plant. Uploading the ACTUAL configuration of an already configured AS-Interface network is also supported. The saved configuration cannot be overwritten at the press of a button and is therefore tamper-proof.

Benefits

- Shorter start-up times through simple configuration at the press of a button
- Construction of flexible distributed structures by use in the DP-slave ET 200M
- Provides diagnostics of the AS-Interface networks
- Well suited also for complex applications thanks to connection options for 62 slaves and integral analog value processing
- Reduction of standstill and servicing times in the event of a fault thanks to the LED indicators:
  - Status of the AS-Interface network
  - Slaves connected and their readiness for operation
  - Monitoring of the AS-Interface mains voltage
- Lower costs for stock keeping and spare parts because the CP can be used for the SIMATIC S7-300 as well as for the ET 200M
- Extra with the CP 343-2P: Improved plant documentation and support for service assignments thanks to a description of the AS-Interface configuration in the STEP 7 project

- No need for the AS-i power supply unit with AS-i Power24V: The AS-Interface cable is supplied through an existing 24 V DC PELV power supply unit. An AS-i data decoupling module (e.g. 3RK1 901-1DE12-1AA0) is required for the decoupling, see page 136.
- Operation with an AS-Interface power supply unit (e.g. 3RX9 501-0BA00, see page 135) is also possible without restrictions.

Application

The CP 343-2P / CP 343-2 is the AS-Interface master connection for the SIMATIC S7-300 and the ET 200M.

Through connection to AS-Interface it is possible to access max. 248 DI/248 DO per CP, using 62 A/B slaves with 4DI/4DO each.

With the integrated analog value processing it is easy to transmit analog signals (per CP up to 62 A/B analog slaves with a maximum of two channels each or up to 31 A/B analog slaves with a maximum of 4 channels each).

The CP 343-2P is the further development of the CP 343-2 and contains its entire functionality. An existing STEP 7 user program for a CP 343-2 can thus be used without restrictions with a CP 343-2P. It is only in STEP 7 HW-Config that the two modules are configured differently, with the CP 343-2P offering additional options. This is why the CP 343-2P is recommended.

AS-Interface
Network transitions

DP/AS-i LINK Advanced

■ **Overview**

DP/AS-i LINK Advanced

PN	DP-M	DP-S	ASi-M		
		●	●		

The DP/AS-i LINK Advanced is a compact Network transition between
PROFIBUS (DP Slave) and AS-Interface, with the following features:

- Single and double AS-Interface master (according to AS-Interface Specification V3.0) for connection of 62 AS-Interface slaves or 124 AS-Interface slaves (with a double master)
- Integrated analog value transmission (all analog profiles)
- Integrated ground-fault monitoring for the AS-Interface cable
- User-friendly local diagnostics and start-up by means of a full graphic display and control keys or through a web interface with a standard browser on the PC screen
- Optimum TIA integration using STEP 7
- Integration in non-Siemens engineering tools using the PROFIBUS GSD file
- Vertical integration (standard web interface) through Industrial Ethernet
- Supply voltage from the AS-Interface shaped cable or alternatively with 24 V DC (optional)
- Suitable for AS-i Power24V (product version 4 and higher / firmware version 2.1.20) and standard AS-i (30 V)
- Module exchange without entering the connection parameters (PROFIBUS address etc) using C-PLUG (optional)

Design
- Compact plastic enclosure in degree of protection IP20 for standard rail mounting
- COMBICON plug-in screw terminals
- Compact design:
  - Pixel graphics display in the front panel for detailed indication of the operating state and readiness for operation of all connected AS-Interface slaves
  - 6 pushbuttons for starting up and testing the AS-Interface line directly on the DP/AS-i LINK Advanced
  - LED indication of the operating state of PROFIBUS DP and AS-Interface
  - Integrated Ethernet port (RJ45 socket) for user-friendly start-up, diagnostics and testing of DP/AS-i LINK Advanced through a web interface using a standard browser
- Small mounting depth thanks to recessed plug mounting
- Operation without fans and batteries

Functionality

Communication

The DP/AS-i LINK Advanced enables a PROFIBUS DP master to cyclically access the I/O data of all the slaves of a lower-level AS-Interface segment. Also supported are the expanded slave types with higher I/O data volume according to AS-i Specification V3.0.

The DP/AS-i LINK Advanced occupies the following address area:

- As a single master: 32 bytes of input data and 32 bytes of output data in which the I/O data of the connected AS-Interface slaves (standard and A/B slaves) of an AS-i line are stored.
- A double master occupies twice the number of bytes.

The size of the input/output image can be compressed so that only the actually required I/O address area is occupied in the system of the DP master.

The integrated evaluation of analog signals is just as easy as access to digital values because the analog process data also lie directly in the I/O address area of the CPU.

PROFIBUS DP-V1 Masters also provide the option of triggering AS-Interface Master calls over the acyclic PROFIBUS services (e. g. write parameters, amend addresses, read diagnostic values).

Using an operating display in AS-i Link it is possible to fully commission the lower-level AS-Interface line.

DP/AS-i LINK Advanced is equipped with an additional Ethernet port which enables use of the integrated web server. The web server can be called up with any standard web browser (e. g. Internet Explorer) without additional software. It allows all diagnostics information to be shown on the PC and the bus configuration and, if applicable, any adjustments, to be displayed. Firmware updates are also possible using this port.

The optional C-PLUG supports module exchange without entering the connection parameters (IP address etc.), keeping downtimes to a minimum in the event of a fault.

Diagnostics

The following diagnostics is possible using LEDs, the display and control keys, web interface or STEP 7:

- Operating state of the DP/AS-i LINK Advanced
- Status of the link as a PROFIBUS DP slave
- Diagnostics of the AS-Interface network
- Message frame statistics
- Standard diagnostics pages in the web interface for fast diagnostics access through Ethernet using a standard browser
- For the use of the web interfaces are no network settings on the PC necessary (Zeroconf procedure).
- The reporting of diagnostic events is optional via E-Mail or SNMP Trap possible. The integrated diagnostic buffer saves the events including time stamp.

Configuration

The DP/AS-i LINK Advanced can be configured as follows:

- With STEP 7 as of V5.4: With STEP 7 configuring the AS-Interface configuration can be uploaded in STEP 7. Can also be AS-Interface slaves from Siemens conveniently configure in HW Config (slave selection dialog).
- By adopting the ACTUAL configuration of the AS-Interface on the display
- Alternatively DP/AS-i LINK Advanced can be integrated into the engineering tool over the PROFIBUS GSD file (e. g. for STEP 7 versions below V5.4 or engineering tools from third-party software houses).

Benefits

g **e** **get** **Designed for Industry**

- Short start-up times through simple configuration at the press of a button and testing of the AS-Interface line using the display or web interface
- Reduction of standstill and servicing times in the event of a slave failure thanks to user-friendly diagnostics using the display or web interface and through simple module exchange with the help of the C-PLUG exchange medium
- Reduced amount of engineering work thanks to user-friendly configuration of Siemens slaves using the slave catalog in HW-Config (STEP 7)

- Costs saved by the double AS-Interface master when large volumes of project data are involved
- Saves the need for AS-i power pack with AS-i Power24V: The AS-Interface cable assembly is fed through an existing 24 V DC PELV power pack. For decoupling an AS-i data decoupling module is required, see power supply units and data decoupling modules.
- Standard mode with AS-Interface power supply (see power supply units and data decoupling modules) possible without restrictions, whereby no further operating voltage is required

Application

The DP/AS-i LINK Advanced is a PROFIBUS DP-V1 slave (according to EN 50170) and an AS-Interface master (based on AS-Interface Specification V3.0 according to IEC 62026-2). It enables transparent data access to AS-Interface from PROFIBUS DP.

Exchanging data with the PROFIBUS DP master

PROFIBUS DP masters (DP-V0) can exchange I/O data with AS-Interface in cyclic mode. PROFIBUS DP masters with acyclic services (DP-V1) are able in addition to initiate AS-Interface master calls (e. g. reading/writing the AS-i configuration during normal operation). As such, the DP/AS-i LINK Advanced is particularly well suited for a decentral construction and for connection of a lower-level AS-Interface network.

Single masters

For applications with typical volumes of project data it is sufficient to use the DP/AS-i LINK Advanced in its version as an AS-Interface single master. The single master can operate up to 248 DI/248 DO, using 62 A/B slaves with 4 DI/4 DO each.

Double masters

For applications with large volumes of project data the DP/AS-i LINK Advanced in its version as an AS-Interface double master is used. In this case, twice the volume of project data can be used on two AS-Interface lines running independently of each other. The double master can operate up to 496 DI/496 DO, using 2 AS-i networks with 62 A/B slaves each with 4DI/4DO each.

Integration of AS-Interface on PROFIBUS through DP/AS-i LINK Advanced as single/double master

Overview

DP/AS-Interface Link 20E

PN	DP-M	DP-S	ASi-M		
		●	●		

DP/AS-Interface Link 20E connects PROFIBUS DP to AS-Interface and has the following features.

- PROFIBUS DP slave and AS-Interface master
- Up to 62 AS-Interface slaves, each with 4 digital inputs and 4 digital outputs as well as analog slaves can be connected
- Integrated analog value transmission (all analog profiles)
- Supports all AS-Interface master functions according to the AS-Interface Specification V3.0
- Supply from AS-Interface cable; hence no additional power supply required
- Supports the uploading of the AS-Interface configuration in STEP 7 V5.2 and higher

Design

- Compact plastic enclosure in degree of protection IP20 for standard rail mounting
- LEDs in the front panel for indicating the operating state and functional readiness of all connected slaves
- Setting option for PROFIBUS DP address by pressing a button
- LED indication of the PROFIBUS DP slave address, DP bus faults and diagnostics
- Two pushbuttons for switching over the operating state and for adopting the existing ACTUAL configuration as the DESIRED configuration

Functionality

Communication

DP/AS-Interface Link 20E enables a DP master to access all the slaves of an AS-Interface network.

DP/AS-Interface Link 20E occupies as standard 32 bytes of input data and 32 bytes of output data in which the digital I/O data of the connected AS-Interface slaves (standard and A/B slaves) of an AS-i line are stored.

The size of the input/output image can be compressed so that only the actually required I/O address area is occupied in the system of the DP master.

The analog I/O data can be accessed with the S7 system functions for read/write data record.

Configuration

The DP/AS-Interface Link 20E is configured as follows:

- With STEP 7 as of Version V5.1 SP2:
  With STEP 7 configuring the AS-Interface configuration can be uploaded in STEP 7 V5.2 and higher. Can also be AS-Interface slaves from Siemens conveniently configure in HW Config (slave selection dialog).
- By adopting the ACTUAL configuration of the AS-Interface by the using the SET pushbutton on the front panel.
- Alternatively, DP/AS-Interface Link 20E can be integrated by means of the PROFIBUS GSD file in the engineering tool (e. g. for STEP 7 V5.1 and lower or for non-Siemens engineering tools).

Benefits

get   **Designed for Industry**

- Reduction of installation costs because the power supply comes completely from the AS-Interface cable, making an additional power supply superfluous

- Short start-up times through simple configuration at the press of a button
- Reduction of standstill and servicing times in the event of a slave failure thanks to the LED indicators
- Easy and fast start-up through reading out the AS-Interface configuration

Application

The DP/AS-Interface Link 20E is a PROFIBUS DP slave (according to IEC 61158/IEC 61784) and an AS-Interface master (according to IEC 62026-2). It enables the AS-Interface to be operated on PROFIBUS DP.

DP/AS-Interface Link 20E can operate up to 248 DI / 248 DO when using 62 A/B slaves with 4DI/4DO each.

PROFIBUS DP masters (DP-V0) can exchange I/O data with AS-Interface in cyclic mode.

PROFIBUS DP masters with acyclic services (DP-V1) are able in addition to initiate AS-Interface master calls (e. g. reading/writing the AS-i configuration during normal operation).

■ **Overview**

DP/AS-i F-Link

PN	DP-M	DP-S	ASi-M		
		●	●		

The DP/AS-i F-Link is a compact, safety-oriented network transition between PROFIBUS (DP Slave) and AS-Interface, with the following
features:

- Monitoring the inputs of safety-oriented digital AS-i slaves (ASIsafe slaves) and forwarding of data through PROFIsafe. No additional safety-oriented components required for the AS-Interface (e. g. safety monitor)
- Can be used up to Category 4 according to EN 954-1, to PL e according to EN ISO 13849-1 and to SIL 3 according to IEC 62061/IEC 61508.
- Connection of up to 62 AS-Interface slaves
- Supports all AS-Interface master functions according to the AS-Interface Specification V3.0
- Typically easy transmission of non-safety-oriented input/ output data of all AS-i slaves
- Integrated analog value transmission (all analog profiles)
- Direct integration in PROFIBUS networks. Optional integration in PROFINET environments through PROFINET/PROFIBUS gateway (IE/PB Link PN IO) or through SIMATIC S7 315/317/319 F PN/DP or S7-416F-3 PN/DP
- Connection to ET 200S with IM-F-CPU using DP master module is possible
- Optimum TIA integration in STEP 7 using Object Manager, integration in non-Siemens engineering tools using PROFIBUS GSD file
- Local diagnostics using LEDs and display with control keys

Design

- Rugged, slim plastic enclosure, degree of protection IP20, for standard rail mounting or wall mounting (with adapter)
- Compact design:
  - LEDs in the front panel for indicating the operating state and functional readiness of all connected slaves
  - 2 buttons on the front for start-up and call up of diagnostics information
  - 4 LEDs for indication of the operating state of the device, of PROFIBUS DP and the AS-Interface network
  - Front PROFIBUS DP connection with sub D connector
  - Removable terminal blocks for connection of AS-i +/- and control supply voltage (over 24 V DC PELV power supply unit)
  - Narrow width (45 mm)
- Operation without fans and batteries
- Fast device replacement in the event of a fault

Functionality

Communication principle

The PROFIBUS DP master or the safe control communicates with the AS-Interface slaves over the DP/AS-i F-Link.
The AS-Interface process data are mapped in different data areas for non-safety-oriented input and output data and safety-oriented input data.

Diagnostics

Extensive diagnostics is possible using the four LEDs, display and control keys or SIMATIC S7. Further details can be found in the manual.

Configuration

The DP/AS-i F-Link is configured as follows:

- With STEP 7 as of Version V5.4 SP1: In particular, Siemens AS-Interface slaves can be conveniently configured via the slave selection dialog.
- Uploading the actual configuration of an already configured AS-Interface network in a STEP 7 project is possible.
- Alternatively, DP/AS-i F-Link can be integrated by means of the PROFIBUS GSD file in the engineering tool As a start-up aid, it is also possible to adopt the ACTUAL configuration in the appliance storage device directly on the appliance to activate the AS-interface slaves.

Programming

In contrast to the AS-Interface safety monitor, DP/AS-i F-Link is a pure gateway, which does not run through its own safety logic. Programming of the safety function is implemented at the level of the higher-level failsafe PLC, e. g.:

- With Distributed Safety, Version V5.4 SP1 or higher for SIMATIC S7-300F/416F
- With the SAFETY INTEGRATED "SI-Basic" or "SI-COMFORT NCU" Software for SINUMERIK 840D pl/sl

The safety and standard range can access the digital and analog I/O data of the connected AS-Interface slaves directly through the I/O address area of the CPU.

6

AS-Interface
Network transitions

DP/AS-i F-Link

■ Benefits

get **get** Designed for Industry

- Gaps in (bus-based) safety technology closed: safety-oriented signals (EMERGENCY-STOP, door tumbler, light curtains etc.) collected with AS-i and transferred to higher-level F-PLC. This enables:
  - Quick installation, easy commissioning: Use of AS-i virtues in the field now fully consistent for Safety Integrated
  - Cost-effective solution as ASIsafe is ideally suited for the collection of "fewer but more distributed failsafe bits".
- Price advantage: As a fully fledged AS-i master according to Specification V3.0, more input and outputs can be used, e. g.:
  - up to 248 DI / 248 DO when using 62 A/B slaves with 4DI/4DO each
  - up to 62 digital or analog slaves
- Investment protection:
  - Connection to PROFIBUS networks, such as DP/AS-i Link Advanced or DP/AS-Interface Link 20E
  - Downward compatibility to AS-Interface specification V2
  - Open for modern automation concepts with AS-i
- Teaching the code sequences of ASIsafe slaves is possible at the press of a button
- Reduced amount of engineering work thanks to user-friendly configuration of all AS-i slaves from Siemens using the slave selection dialog in HW-Config (STEP 7), including setting the F-parameter of the ASIsafe slaves modeled on PROFIsafe slaves
- Cost-savings thanks to programming of the safety logic with the familiar, powerful commands of the distributed safety packages from the failsafe SIMATIC PLC in F-FUP or F-FOP, incl. TÜV-certified function blocks for typical safety applications
- Use in machine-tools under SINUMERIK 840 D (pl/sl) possible
- Reduction of standstill and servicing times in the event of a slave failure thanks to user-friendly diagnostics using the display and through simple module exchange (only a few settings by control keys are required, without use of the configuring tool)

■ Application

Links between PROFIsafe and ASIsafe

The DP/AS-i F-Link is a PROFIBUS DP-V1 slave (according to IEC 61508/ IEC 61784) and an AS-Interface master (based on AS-Interface Specification V3.0 according to IEC 62026-2). It enables transparent data access to AS-Interface from PROFIBUS DP. The DP/AS-i F-Link is also the only AS-i master with which safety-oriented input data can be passed from ASIsafe slaves via the PROFIsafe protocol to a failsafe CPU with PROFIBUS DP master. No additional safety cabling or monitoring is required (in particular no AS-Interface safety monitor). The transmission of binary values or analog values is possible depending on the slave type. All slaves according to AS-Interface Specification V2.0, V2.1 or V3.0 can be used as AS-i slaves.

PROFIBUS DP masters according to DP-V0 or DP-V1 can exchange I/O data with lower-level AS-i slaves in cyclic mode. PROFIBUS DP masters with acyclic services according to DP-V1 are able in addition to initiate AS-i command calls (e. g. reading/writing the AS-i configuration during normal operation). In addition to digital I/O data, analog data can also be saved performantly in the cyclic periphery of a failsafe S7-300/S7-416 F-CPU.

In configuring mode the DP/AS-i F-Link reads in the configuration data of the peripherals on the AS-Interface. Slave addresses can be set using the display and the control keys, and the code sequences of safe AS-i slaves can be taught.

During operation, four display LEDs and the display provide detailed diagnostics information, which directly localizes the fault if required. Using the PLC user program it is possible to read out diagnostics data records and make them available to a higher-level operating and monitoring system (e. g. WinCC Flexible or TRANSLINE HMI).

6

■ **Application** (continued)

Network connectivity

The DP/AS-i F-Link can be used in PROFIBUS and PROFINET networks as follows:

Integration in PROFIBUS networks under SIMATIC F PLC

Integration in PROFINET networks under SIMATIC F-SPS (alternatively can also be integrated through IE/PB Link)

6

AS-Interface
Network transitions

DP/AS-i F-Link

■ **Application** (continued)

■ **Overview**

IE/AS-i LINK PN IO

PN	DP-M	DP-S	ASi-M		
●			●		

The IE/AS-i LINK PN IO is a compact network transition between PROFINET/Industrial Ethernet (PROFINET IO Device) and AS-Interface, with the following features:

- Single and double AS-Interface master (according to AS-Interface Specification V3.0) for connection of 62 AS-Interface slaves or 124 AS-Interface slaves (with a double master)
- Integrated analog value transmission (all analog profiles)
- Integrated ground-fault monitoring for the AS-Interface cable
- User-friendly local diagnostics and start-up by means of a full graphic display and control keys or through a web interface with a standard browser on the PC screen
- Optimum TIA integration using STEP 7
- Integration in non-Siemens engineering tools using the PROFINET GSD file
- Vertical integration (standard web interface) through Industrial Ethernet
- Supply via AS-Interface cable or with 24 V DC
- Suitable for AS-i Power24V (product version 2 and higher / firmware version 2.0.20) and standard AS-i (30 V)
- Module exchange without entering the connection parameters (IP address etc) using C-PLUG (optional)
- Costs saved by the double AS-Interface master when large volumes of project data are involved

Design

- Compact plastic enclosure in degree of protection IP20 for standard rail mounting
- COMBICON plug-in screw terminals
- Compact design:
  - Pixel graphics display in the front panel for detailed indication of the operating state and readiness for operation of all connected AS-Interface slaves
  - Six pushbuttons for starting up and testing the AS-Interface line directly on the IE/AS-i LINK PN IO
  - LED indication of the operating state of PROFINET IO and AS-Interface
  - Integrated 2-port switch (RJ45 socket) for connection to Industrial Ethernet supports the line topology with an external switch
- Small mounting depth thanks to recessed plug mounting
- Operation without fans and batteries

Functionality

Communication

The IE/AS-i LINK PN IO enables a PROFINET IO controller to cyclically access the I/O data of all the slaves of a lower-level AS-Interface segment. Also supported are the expanded slave types with higher I/O data volume according to AS-i Specification V3.0.

The IE/AS-i LINK PN IO occupies the following address area:

- As a single master or IO controller with full expansion: 62 bytes of input data and 62 bytes of output data in which the I/O data of the connected AS-Interface slaves (standard and A/B slaves) of an AS-i line are stored.
- As double master, double the number of bytes.

The size of the input/output image can be compressed so that only the actually required I/O address area is occupied in the system of the DP master.

The integrated evaluation of analog signals is just as easy as access to digital values because the analog process data also lie directly in the I/O address area of the CPU.

PROFINET IO controllers are able in addition to initiate AS-Interface master calls (e. g. to write parameters, change addresses, read diagnostic values) through the acyclic PROFINET services.

Using an operating display in AS-Interface Link it is possible to fully commission the lower-level AS-i line.

The IE/AS-i LINK PN IO is equipped with two Ethernet ports which are connected by an internal switch. With the Ethernet it is possible in addition to use the integrated web server. The web server can be called up with any standard web browser (e. g. Internet Explorer) without additional software. It enables the PC to present all diagnostics information and to display the set bus configuration and parameters as well as their adaptation where applicable. Firmware updates are also possible using this port.

The optional C-PLUG supports module exchange without entering the connection parameters (IP address etc.), keeping downtimes to a minimum in the event of a fault.

Diagnostics

The following diagnostics is possible using the display and control keys, web interface or STEP 7:

- Operating state of the E/AS-i LINK PN IO
- Status of the link as a PROFINET IO device
- Diagnostics of the AS-Interface network
- Message frame statistics
- Standard diagnostics pages in the web interface for fast diagnostics access through Ethernet using a standard browser
- For the use of the web interfaces are no network settings on the PC necessary (Zeroconf procedure).
- The reporting of diagnostic events is optional via E-Mail or SNMP Trap possible. The integrated diagnostic buffer saves the events including time stamp.

Configuration

The IE/AS-i LINK PN IO is configured as follows:

- STEP 7 V5.4 or higher is required for configuring the full functional scope of the IE/AS-i LINK PN IO. With STEP 7 configuring the AS-Interface configuration can be uploaded in STEP 7 V5.4 SP2 and higher. Can also be AS-Interface slaves from Siemens conveniently configure in HW Config (slave selection dialog).
- Alternatively, E/AS-i LINK PN IO can be integrated by means of the PROFINET GSD file in the engineering tool (e. g. for STEP 7 V5.4 SP2 and lower or for non-Siemens engineering tools).

6

Benefits

g e t   **get**   Designed for Industry

- Short start-up times through simple configuration at the press of a button and testing of the AS-Interface line using the display or web interface
- Reduction of standstill and servicing times in the event of a slave failure thanks to user-friendly diagnostics using the display or web interface

- Costs saved by the double AS-Interface master when large volumes of project data are involved
- Saves the need for AS-i power pack with AS-i Power24V: The AS-Interface cable assembly is fed through an existing 24 V DC PELV power pack. For decoupling an AS-i data decoupling module is required, see power supply units and data decoupling modules.
- Standard mode with AS-Interface power supply (see power supply units and data decoupling modules) possible without restrictions, whereby no further operating voltage is required

Application

The DP/AS-i LINK PN IO is a PROFINET IO device (according to IEC 61158/IEC 61784) and an AS-Interface master (based on AS-Interface Specification V3.0 according to IEC 62026-2). It enables transparent data access to AS-Interface from Industrial Ethernet.

Exchanging data with PROFINET IO controllers

PROFINET IO controllers can exchange I/O data with AS-Interface in cyclic mode and can perform AS-i master calls in addition with acyclic services (e. g. reading/writing the AS-i configuration during normal operation). As such, the IE/AS-i LINK PN IO is particularly well suited for a decentral construction and for connection of a lower-level AS-Interface network.

Single masters

For applications with typical volumes of project data it is sufficient to use the IE/AS-i LINK PN IO in its version as an AS-i single master. The single master can operate up to 248 DI/248 DO, using 62 A/B slaves with 4DI/4DO each.

Double masters

For applications with large volumes of project data the IE/AS-i LINK PN IO in its version as an AS-i double master is used. In this case, twice the volume of project data can be used on two AS-i lines running independently of each other. The double master can operate up to 496 DI/496 DO, using 2 AS-i networks with 62 A/B slaves each with 4DI/4DO each.

Integration of AS-Interface on PROFINET through IE/AS-i LINK PN IO as single/double master

■ Application (continued)

Wireless communication

Using an upstream IWLAN client module, e. g.
SCALANCE W746-1PRO, an AS-Interface line can be integrated
in the PROFINET world by wireless means.

Sample uses are applications which up to now have been per-
formed with fault-prone tow chain or collector wire technology.
Maintenance costs are thus reduced.

AS-Interface slaves
I/O modules for operation in the field, high degree of protection

■ Overview

K60

K20

K45

Three coordinated series of AS-Interface compact modules with digital and analog compact modules and a high degree of protection are available for operation in the field:

- Series K60 (digital and analog)
- Series K45 (digital)
- Series K20 (digital)

All compact modules are characterized by particularly simple handling. The K60 and K45 modules are mounted with a mounting plate. The mounting plate is used to receive the AS-Interface flat cables and enables mounting on a wall or standard mounting rail.

The K20 modules are directly mounted without a mounting plate and connected to the AS-Interface using a round cable.

Connection types

For flexible connection of different sensors and actuators, the following PIN assignments are available on the I/O modules with M12 sockets:

Standard assignment

With the standard assignment, one sensor/actuator is connected per M12 socket. In this case the signal for the outputs is at PIN4 while the signal for the inputs is detected at PIN4 and PIN2. As the result, sensors can be connected directly to PIN2 and PIN4.

Y assignment

With the Y assignment, two sensors or two actuators can be connected to one M12 socket. In this case, both PIN4 and PIN2 are provided for respectively one sensor/actuator signal on each M12 socket.

Y-II assignment

The Y-II assignment offers the following options:

- Individual connection of a sensor/actuator to one M12 socket
- Connection of respectively two sensors/actuators to one M12 socket as follows:
  - The signal of the first sensor/actuator is connected to PIN4 of the first socket.
  - The signal of the second sensor/actuator is connected to PIN2 of the first socket and to PIN4 of the second socket.
  In this case, the second socket is not required and is closed with a sealing cap.

Overview of digital compact modules

The following table provides an overview of the important features of the digital compact modules.

Overview

The K60 digital AS-Interface compact modules are characterized by optimized handling characteristics and user-friendliness. They permit the mounting times and start-up times of AS-Interface to be reduced by up to 40 %.

Assembly of the K60 modules is performed with a mounting plate which accommodates the AS-Interface shaped cables. Two different mounting plates are offered for

- Wall mounting
- Standard rail mounting

Addressing of the K60 modules is performed using an addressing socket integrated in the compact module. The addresses can also be assigned after installed.

K60 compact modules with a maximum of four digital inputs and outputs

These compact modules contain the communication electronics and the M12 standard connections for inputs and outputs. Using M12 standard connectors, a maximum of four sensors and four actuators can be simply and reliably connected to the compact module.

The mounting plate and the compact module are joined together by means of a screw, with simultaneous contacting of the AS-Interface cable by the service-proven insulation piercing method.

K60 compact modules with a maximum of eight digital inputs

These modules have eight digital inputs for connection through M12 plugs.

The module requires two AS-Interface addresses for processing all eight inputs. As with every compact module, the addressing can be performed through a double addressing socket.

K60 compact modules with a four digital inputs and outputs according to AS-Interface Specification 3.0

The new AS-i specification 3.0 adds a number of completely new features to the AS-Interface bus system. The extended address mode (A/B addresses) enables the connection of up to 62 slaves on one AS-i network. With the extended address mode according to Specification 3.0, four outputs are now possible even with A/B slaves (instead of only three outputs possible up to now with specification 2.1). Hence with full expansion of an AS-i network, there are now 248 inputs as well as 248 outputs available on one AS-i system. Modules with four inputs and four outputs as A/B slaves according to Specification 3.0 are also available as K60 compact modules.

Please note that these modules can be used only with a new master according to AS-i specification 3.0 (e.g. the new DP/AS-i LINK Advanced or IE/AS-i LINK PN IO) and that the cycle times for the outputs can extend to max. 20 ms.

More information

Other conditions for safe operation see section Technical Information at

www.siemens.com/industrial-controls/support

K60 data couplers

An AS-Interface data coupler has been added to the K60 compact module range. Integrated in this module are two AS-i slaves which are connected to two different AS-i networks. Each of the two integrated slaves has four virtual inputs and four virtual outputs. The bidirectional data transmission of four data bits between two AS-i networks is thus possible in a simple and cost-effective manner. The data coupler need its own address in each AS-i network.

Each AS-i network works with a different cycle time depending on the number of stations. Hence two AS-i networks are not necessarily synchronous. For this reason the AS-i data coupler can be used to transmit only standard data and no safe data.

K60 compact modules for use in hazardous areas (ATEX)

Two versions of the K60 modules are available for operation in Zone 22 hazardous areas according to Classification II 3D (dusty atmosphere, non-conductive dust). The version with four inputs and four outputs has the designation (Ex) II 3D Ex tD A22 IP65X T75°C and the version with four inputs has the designation (Ex) II 3D Ex tD A22 IP65X T60°C.

Special conditions have to be observed for the safe operation of these devices. In particular the module must be protected by suitable protective measures from mechanical damage.

■ Overview

Operation in particularly harsh environments

K60R module in degree of protection IP68/IP69K

Modules with degree of protection IP67 cannot be used in areas exposed to permanently high levels of humidity, in applications with drilling emulsions and cutting oils or when cleaning with high-pressure cleaners. The answer for these applications is provided by the expansion of the K60 compact modules with the K60R module with degree of protection IP68/IP69K.

The K60R modules are connected instead of the AS-Interface flat cable using a round cable with M12 cable box. The AS-Interface bus cable and the 24 V DC auxiliary voltage supply are routed in this case in a shared round cable.

Degree of protection IP68 permits many new applications, which were impossible with the former field modules with degree of protection IP67. In applications such as filling plants or machine-tools the K60R with degree of protection IP68 enables the module to be used directly in zones exposed to permanent loading by humidity. It is thus possible to make even more rigorous savings in wiring with AS-Interface. The IP68 test conditions can be found in the section "IP68/IP69K tests".

Cleaning with high-pressure cleaners, such as is regularly performed in the food drinks industry for instance, is possible without difficulty (IP69K).

In applications with tow chains, many users rely on placing the AS-Interface bus cable in a round cable. With the K60R module there is a round cable connection for direct connection to a round cable. No adapter is required.

Mounting

The same mounting plates are used as for the K60 modules. Instead of using flat cables the K60R is connected using a 4-pole round cable with an M12 connection. With the K60R the mounting plate thus serves only as a fixture and ground terminal.

Addressing

Addressing is performed using the same socket as for the bus connection. Connecting the module to the addressing unit takes place over a 3-pole standard M12 cable.

When the mounting is finished, the module is connected with the addressing cable to the addressing unit and addressed. The addressing cable is then removed and the module connected to the bus cable.

Connection

K60R connection options

In the IP67 environment the service-proven standard components are connected using flat cables. Spur lines are laid into the IP68 environment by means of an AS-Interface M12 feeder (3RK1 901-1NR..). The module is connected with a round cable to an M12 cable box. For this purpose the module has an M12 bus connection instead of the former addressing socket. The AS-Interface bus cable and the 24 V DC auxiliary voltage are routed together in a 4-pole round cable. There must be no ground conductor in this round cable. Connection to ground is made through the mounting plate.

In the IP68 environment only cables with extruded M12 plugs may be used.

To connect more than one K60R module to one spur line, the spur line can be split again using a T distributor (3RK1 901-1TR00) with degree of protection IP68.

Please note the following boundary conditions:

- The configuration guidelines for AS-Interface apply. For all M12 connecting cables the maximum permissible current is limited to 4 A. The cross-section of these cables amounts to just 0.34 mm^2. For connection of the K60R modules, the aforementioned M12 connecting cables can be used for the spur lines. The voltage drop caused by the ohmic resistance (approx. $0.11\Omega/m$) must be taken into account.

- For round cable connections with shared AS-i and U_{aux} in a single cable, the following maximum lengths apply:
  - per spur line from feeder to module: maximum 5 m
  - total of all round cable segments in an AS-Interface network: maximum 20 m

Tests IP68/IP69K

- K60R modules were tested with the following tests:
- Stricter test than IP67: 90 min at 1.8 m depth of water (IP67: 30 min at 1 m depth of water)
- Salt water test: Five months in salt water, 20 cm deep, at room temperature
- Test with particularly creepable oil: Five months completely under oil at room temperature

AS-Interface slaves
I/O modules for operation in the field, high degree of protection

Digital I/O modules IP68/IP69K - K60R

■ **Overview** (continued)

- Test with drilling emulsion: Five months at room temperature (components of the drilling emulsion: Anionic and non-ionic emulsifiers, paraffinic low-aromatic mineral oil, boric acid alkanolamines, corrosion inhibitors, oil content 40 %)
- Test in oil bath (Excelence 416 oil) with alternating oil bath temperature: 130 cycles of 15 to 55 °C, two months
- Cleaning with a high-pressure cleaner according to IP69K: 80 to 100 bar, 10 to 15 cm distance, time per side > 30 s, water temperature 80 °C

To simulate requirements as realistically as possible the modules were artificially aged prior to the tests by 15 temperature cycles of -25/+85 °C. During the test the modules were connected to 3RX1 connecting cables. Unassigned connections were closed with 3RK1 901-1KA00 sealing caps.

Note:

Sealing caps and M12 connections must be tightened with the correct torque.

■ Overview

K45 compact modules

The K45 series of compact modules supplements the K60 large compact modules which have a proven track record in industry. They are the logical consequence for rounding off the bottom end of the existing product range.

The acclaimed advantages of the existing K60 compact modules are fully emulated by the far smaller K45 modules. Their footprint is the same as that of the user modules. However, they have a mounting depth which is only two-thirds of the user module and hence an exact match for the compact module family.

Yet in spite of these small dimensions all the modules have large labels and an integrated addressing socket.

Two mounting plates are offered for the K45 compact modules:
• The mounting plate for wall mounting has a hole pattern that is identical to that of the K60 compact modules. This means that K60 compact modules can be mounted together with K45 modules in an aligned arrangement. The flat cables can be inserted in the recesses of the mounting plates where they cause no hindrance.
• The mounting plate for standard rail mounting has a hole pattern that is identical to that of the user modules.

Mounting the flat cables is now easier than ever. The yellow and black AS-Interface flat cable can be inserted into the mounting plates from the left or right regardless of the position of the coding lug. The correct polarity of the applied voltages is always guaranteed.

Sensors/actuators are connected using M12 sockets. The 4I module can be ordered optionally with M8 connection sockets.

Overview

Digital I/O modules IP67 – K20

The K20 compact module range rounds off the AS-Interface compact modules with a particularly slim design and a width of a mere 20 mm. Thanks to its extremely compact dimensions, these modules are particularly suited for handling machine applications in the field of production engineering where modules need to be arranged in the smallest of spaces.

Robotics is yet another application area. Instead of the AS-Interface flat cable, the K20 modules are connected to AS-Interface over a round cable with M12 cable box.
The AS-Interface bus cable and the 24 V DC auxiliary power supply are routed in this case in a shared round cable. This enables extremely compact installation.

The flexibility of the round cable means that it can also be used on moving machine parts without any problems. The K20 modules are also ideal for such applications as their non-encapsulated design makes them particularly light in weight.

In applications with tow chains, many users rely on placing the AS-Interface bus cable in a round cable. In this case, the K20 modules support direct connection to the round cable. No flat to round cable adapter is required.

The K20 compact module range includes standard AS-Interface modules, as well as an ASIsafe version for the connection of fail-safe sensors, such as EMERGENCY-STOP pushbuttons or protective door monitoring. All standard AS-Interface K20 modules support, as far as technically possible, the expanded address mode (A/B addresses) according to AS-Interface specification 2.1, which enables connection of 62 stations to an AS-Interface network. The K20 module with four inputs and four outputs works in expanded address mode according to AS-Interface specification 3.0 which, for the first time, supports four outputs with an A/B slave, thus enabling 248 inputs and 248 outputs in a fully expanded AS-Interface network.

For particularly space-saving dimensions, the sensors and actuators are connected over M8 plug-in connectors. Alternatively, M12 connectors with Y assignment can be used.

AS-Interface slaves
I/O modules for operation in the field, high degree of protection

■ Overview

The AS-Interface user modules are the first module generation for AS-Interface.

Today, innovated and further improved modules are available in the form of the K45 and K60 series of compact modules. We recommend replacing the user modules in future with the K45 compact module series. The user modules will be available for a limited time in order to meet the demand for replacements.

Note:

More information can be found in the Industry Mall at
www.siemens.com/industrymall

Advantages of the K45 compact modules

The K45 compact modules provide extra advantages in addition to the functionality of the user modules:

- An integrated addressing socket enables the module to be addressed in the installed state
- Time is saved when mounting the module: Mounting with only one screw thanks to hinge system
- Extensive diagnostics by LED on the module (e. g. display of zero address, no communication with master, overload)
- Random insertion of the AS-Interface flat cable irrespective of the position of the profiled lug
- Smaller dimensions
- Versions with M12 and M8 connection sockets enable the direct connection of all sensors
- Modules in A/B technology enable up to 62 slaves on one AS-Interface network

3RG9 001-0CB00	4 inputs solid-state outputs	3RK1 100-1CQ20-0AA3	4 inputs solid-state outputs

Note:

To use the K45 modules you require the 3RK1 901-2EA00 (wall mounting) or 3RK1 901-2DA00 (standard rail mounting) K45 mounting plates instead of the 3RG9 010-0AA00 and 3RG9 030-0AA00 coupling modules.

AS-Interface slaves
I/O modules for operation in the field, high degree of protection

Analog I/O modules, IP67 - K60

Overview

K60 analog compact module

AS-Interface analog modules from the K60 compact series detect or issue analog signals locally. These modules are linked to the higher-level controller through an AS-Interface master according to specification 2.1 or specification 3.0.

The analog modules are divided into five groups:
- Input module for sensors with current signal
- Input module for sensors with voltage signal
- Input module for sensors with thermal resistor
- Output module for current actuators
- Output module for voltage actuators

The input modules according to profile 7.3/7.4 are available with two or four input channels. It is possible in addition to convert the two-channel module to using only one input channel, thus enabling very short times before the analog value is available. The conversion is effected by means of a jumper plug at socket 3. The transmission times achieved with analog modules according to Profile 7.A.9 are shorter by half than those achieved with Profile 7.3/7.4. Operation is adjustable in this case, e. g. it is possible to choose with the ID1 Code whether the module is operated with one or two channels.

The output modules are configured as two-channel modules as standard.

The input and output channels are electrically separated from the AS-Interface network. If sensors with a higher power requirement are to be connected, more power can be supplied through the auxiliary voltage as an alternative to the internal supply.

In the manual the modules are presented in great detail along with their technical specifications and in-depth notes on operation. Sample function blocks round off the manual.

Benefits

- Analog modules are just as easy to integrate in AS-Interface as digital modules
- Analog values can be easily detected and issued locally
- Preprocessing of the analog value transmission in the master enables rapid evaluation of the analog values
- Up to four values can be detected using one analog module
- Faster transmission and conversion of analog values thanks to the new option for changing over to single-channel operation

In addition, Specification 3.0 now also offers:
- A/B technology, now also with analog modules
- On average, double fast transmission times (only 3 or 4 cycles, depending on the resolution selected)
- Variable adjustable mode: 12 bit or 14 bit resolution, 1 or 2-channel, selectable over the ID1 code
- Extra simple handling of analog processing with masters of Specification 3.0, the DP/AS-i LINK Advanced

■ **Overview**

SlimLine S22.5/S45

F90 module

Flat module

For AS-Interface applications inside control cabinets there are various module series for the most diverse requirements:

- SlimLine S22.5
- SlimLine S45
- F90 module
- Flat module

All modules of these series can be snap-mounted directly on a standard mounting rail or be fastened using screws.

AS-Interface modules in IP20 have direct terminals for the AS-Interface cables and therefore do not require a base.

Series	Spectrum	Mounting on TH35 standard mounting rails according to EN 60715	Wall mounting using push-in lugs (Order No.: 3RP1 903)	Other possibilities
SlimLine S22.5	• 4I (standard and A/B modules) • 4O • 2I/2O (steady-state/relay outputs) • Counters [1] • Ground-fault detection modules [1]	✓	✓	--
SlimLine S45	• 4I/4O (steady-state/relay outputs) • 4I/4O with floating I/Os • 4I/3O (A/B modules) • 4I/4O (A/B modules Spec. 3.0)	✓	✓	--

SlimLine

■ **Overview**

SlimLine modules of the S22.5 and S45 series

SlimLine S45 modules (left) and S22.5 modules (right)

The AS-Interface series of modules for the "SlimLine" control cabinet with degree of protection IP20 creates space in the cabinet and in distributed local boxes.

For these modules the priority was placed on a narrow type of construction. They have a width of only 22.5 mm or 45 mm.

Standard sensors/actuators and the AS-Interface cable can be connected using removable screw-type or spring-type terminals.

Integrated adapters enable mounting onto a standard mounting rail. Disassembly from the standard mounting rail is quick and easy and requires no tools.

With an additional accessory (push-in lugs), the modules can also be screwed on.

All modules are fitted at the front with LEDs which indicate the module's status.

An addressing socket integrated at the front enables the module to be addressed also when it is installed.

In addition to the digital input/output modules there are modules of design S22.5 with special functions. These include:

- Counter module
- Ground-fault detection module

More information about these modules, see

- the section "Modules with special functions" on page 6/70
- Industry Mall at:
  www.siemens.com/industrymall
  Section "Automation" -->
  "SIRIUS Industrial Controls" --> "Industrial Communication" -->
  "AS-Interface" --> "Slaves" --> "Modules with Special Functions"

The new AS-Interface Specification 3.0 adds a number of completely new features to the AS-Interface bus system. The extended address mode (A/B addresses) enables the connection of up to 62 slaves on one AS-Interface network. With the extended address mode according to specification 3.0, four outputs are now possible for the first time even with A/B slaves (instead of only three outputs possible up to now with specification 2.1). Hence with full expansion of an AS-Interface network, there are now 248 inputs as well as 248 outputs available on one AS-Interface system.

Modules with four inputs and four outputs as A/B slaves according to specification 3.0 are also available as SlimLine modules S45.

Note:

Please note that the modules according to Specification 3.0 can be used only with a new master according to AS-Interface Specification 3.0 (e.g. the new DP/AS-i LINK Advanced or IE/AS-i LINK PN IO) and that the cycle times for the outputs can extend to max. 20 ms.

[1] Note: For pad numbering see Technical Specifications

With the 4I/4O or 4I/3O module for printed circuit board mounting it is possible for up to four mechanical contacts or 3-conductor sensors according to IEC 947-5-2 to be connected.
Up to four indicator lights via the 4I/4O module or up to three indicator lights via the 4I/3O module can also be controlled. The power for short-circuit proof solid-state switching outputs is provided from an auxiliary voltage (24 V PELV).

Mounting is very easy using a "Card Edge Board-to-Board Connector". This connector can be ordered for vertical and horizontal mounting from the company AMP, for example:

- 180° version for vertical mounting (AMP): Order No. 530843-2
- 90° version for horizontal mounting (AMP): Order No. 650118-1

If the inputs are loaded with more than 200 mA, the module does not respond to invoking by a master.

AS-Interface slaves
Modules with special functions

Counter modules

■ **Overview**

Counter module with spring-type terminals

The counter module is used to send hexadecimally coded count values (LSB=D0, MSB=D3) to a higher-level controller. The count value is increased by one for each valid count pulse at terminal 8. Beginning at 0, the module counts up to 15 and then begins again at 0. The controller adopts the current value and determines the number of pulses between two host invocations through subtraction from the previous value. The total number of count pulses is determined by adding these differences.

For the values sent to be unambiguous, no more than 15 count values are allowed between two host invocations or AS-Interface master invocations at terminal 8. The maximum permissible transmission frequency is calculated from these times:

$f_{TRmax} = 15 / T_{max}$

T_{max} : max. possible transmission time from the slave to the host

Another condition for the maximum frequency is the pulse shaped required. For the counter to accept a pulse as valid, a Low must have been applied at the input for at least 300 µs and a High for at least 1 ms.
This results in a maximum frequency of
$f_{Zmax} = 1 / 1.3$ ms = 769 Hz independent of the control system (see figure).

Maximum frequency for the counter module

If the time criterion stipulated in the graphic is violated, the count value is rejected.

The counter is active only for the reset parameter P2 (default). The counter is deleted when P2 is set, and the incoming count pulses are not registered until after P2 is reset again.

Note:

A customized function block is necessary or must be programmed.

Overview

"Ground faults in any control circuit must not lead to unintentional starting or potentially hazardous movements or prevent the machine from stopping." (EN 60204-1 / VDE 0113-1).

The AS-Interface ground-fault detection module is used to meet these requirements. Using this module from the SlimLine series, ground faults in AS-Interface systems can be reliably detected and reported.

The following ground faults are detected:
• Ground fault from AS-i "+"
• Ground fault from AS-i "-"
• Ground fault from sensors and actuators which are supplied from the AS-Interface voltage.

Note:

Not suitable for AS-Interface Power24V.

Overvoltage protection module

Overview

AS-Interface overvoltage protection module

The AS-Interface overvoltage protection module protects downstream AS-Interface devices or individual sections in AS-Interface networks from conducted overvoltages which can be caused by switching operations and remote lightning strikes.

The location of the overvoltage protection module forms within the lightning protection zone concept the transition from zone 1 to 2/3. Direct lightning strikes must be coped with using additional protective measures at the transitions from lightning protection zone 0A to 1.

With the AS-Interface overvoltage protection module it is now also possible to integrate AS-Interface in the overall lightning protection concept of a plant or machine.

The module has the same design and degree of protection (IP67) as the AS-Interface K45 compact modules. It is a passive module without AS-i IC and as such does not need its own address on the AS-Interface network.

The module can be used to protect the AS-Interface cable and the cable for the auxiliary voltage from overvoltage.

Overvoltages are discharged through a ground cable with a green/yellow oil-proof outer sheath. This cable is fixed in the module and must be connected with low resistance to the system's ground.

Rated discharge current I_{sn}

The rated discharge current is the peak value of a surge current with waveform 8/20 microseconds, for which the overvoltage protection module is rated in according to a specific test program.

With waveform 8/20, 100 % of the value is achieved after 8 microseconds and 50 % after 20 microseconds.

Protection level U_p

The protection level of an overvoltage protection module is the highest momentary value of the voltage at the terminals, established in individual tests.

The protection level characterizes the capability of an overvoltage protection module to limit overvoltages to a residual level.

Overview

Every LOGO! can now be connected to the AS-Interface system

AS-Interface connections for LOGO!

Using the AS-Interface connection for LOGO!, an intelligent slave can be integrated in the AS-Interface system. With the modular interface it becomes possible to integrate the different basic units in the system according to their functionality. Similarly, functionalities can be quickly and easily adapted to new requirements by exchanging the basic unit.

The interface module provides four inputs and four outputs on the system. These inputs and outputs do not actually exist in hardware terms, however, but are only virtually present through the interface on the bus.

AS-Interface slaves
Contactors and contactor assemblies – Power contactors for switching motors

Overview

Contactors with communication interface, sizes S00 and S0

Contactor versions with a communication interface are required for the connection to the controller via IO-Link or AS-Interface. The connection is made via function modules, which are mounted on to the front side of the contactors.

Contactors with communication interface in size S00 with spring-type terminals and size S0 with screw terminals

Standards

IEC 60947-1, EN 60947-1,
IEC 60947-4-1, EN 60947-4-1,
IEC 60947-5-1, EN 60947-5-1 (auxiliary switches)

The 3RT20 contactors for switching motors are climate-proof and are tested and suitable for use worldwide.

If the devices are used in ambient conditions which deviate from common industrial conditions (IEC 60721-3-3 "Stationary Use, Weather-Protected"), information must be obtained about possible restrictions with regard to the reliability and endurance of the device and possible protective measures. In this case contact our Technical Assistance.

The 3RT2 contactors are finger-safe according to EN 50274.

The contactors are suitable for screw fixing or for mounting on TH 35 standard mounting rails according to IEC 60715.

Contact reliability

If voltages ≤ 110 V and currents ≤ 100 mA are to be switched, the auxiliary contacts of the 3RT2 contactor or 3RH21 contactor relay should be used as they guarantee a high level of contact reliability.

These auxiliary contacts are suitable for solid-state circuits with currents ≥ 1 mA at a voltage ≥ 17 V.

Connection methods

The 3RT2 contactors are available with screw terminals or spring-type terminals.

Short-circuit protection of the contactors

For more information about short-circuit protection of contactors without overload relay, see Technical Specifications.

To assemble fuseless motor feeders you must select combinations of motor starter protector and contactor as explained in "3RA2 Load Feeders".

Motor protection

3RU21 thermal overload relays or 3RB30 solid-state overload relays can be fitted to the 3RT2 contactors for protection against overload. The overload relays must be ordered separately.

Ratings of induction motors

The quoted rating (in kW) refers to the output power on the motor shaft (according to the nameplate).

Control supply voltage

The contactors with communication interface are available with 24 V DC operation.

Note:

The selection and ordering data for 3RT10 contactors and 3RA23 reversing contactor assemblies with communication interface can be found in chapter 7, "IO-Link".

Overview

These 3RA24 contactor assemblies for wye-delta starting are designed for standard applications.

Note:

Contactor assemblies for wye-delta starting in special applications such as very heavy starting or wye-delta starting of special motors must be customized. Help with designing such special applications is available from Technical Assistance.

The 3RA24 contactor assemblies for wye-delta starting can be ordered as follows:

• complete, fully wired and tested, with electrical and mechanical interlocking
• as individual parts for customer assembly

A dead interval of 50 ms on reversing is already integrated in the function module for wye-delta starting. The auxiliary contacts used in the contactors (see Chapter 7, "IO-Link") are freely available.

Components for customer assembly

Assembly kits with wiring modules and mechanical connectors are available for contactor assemblies for wye-delta starting. Contactors, overload relays, function modules for wye-delta starting, auxiliary switches for electrical interlocking – and if required also feeder terminals – must be ordered separately.

The wiring kits for sizes S00 and S0 contain the top and bottom main conducting path connections between the line and delta contactors (top) and between the delta and star contactors (bottom).

AS-Interface slaves
Contactors and Contactor Assemblies

■ Overview

The function modules for mounting onto contactors enable the assembly of starters and contactor assemblies for direct-on-line, reversing and wye-delta starting without any additional, complicated wiring of the individual components.

These include the fundamental control functions, such as time and sealing functions, which are used for the respective branches and can be connected to the controller via the bus system.

■ Selection and ordering data

3RA27 12-2BA00		
Assembly kits for making 3-pole contactor assemblies The assembly kit contains: mechanical interlock; 2 connecting clips for 2 contactors, wiring modules on the top and bottom		
• For size S00	**3RA29 13-2AA1**	**3RA29 13-2AA2**
3RA29 23-2AA1		
• For size S0		
- For main, auxiliary and control current	**3RA29 23-2AA1**	**--**
- Only for main current [2]	**--**	**3RA29 23-2AA2**
3RA29 23-2AA2		

Applicable contactors or reversing contactor assemblies with communication interface can be be found in chapter 7, "IO-Link".

Note:

When using the function modules, no other auxiliary switches are allowed to be connected to the basic units.

[1] Pre-wired contactor assemblies for reversing start with communication interface can be be found in chapter 7, "IO-Link". When these contactor assemblies are used, the assembly kit for the wiring is already integrated.

[2] Version in size S0 with spring-type terminals:
Only the wiring modules for the main circuit are included.
No connectors are included for the auxiliary and control circuit.

AS-Interface slaves
Motor starters for operation in the control cabinet

SIRIUS 3RA6 compact feeders
General data

■ **Overview**

3RA6 fuseless compact feeders and infeed system for 3RA6

3RA62 reversing starters

Integrated functionality

The SIRIUS 3RA6 compact feeders are a generation of innovative load feeders with the integrated functionality of a motor starter protector, contactor and solid-state overload relay. In addition, various functions of optional mountable accessories (e.g. auxiliary switches, surge suppressors) are already integrated in the SIRIUS compact feeder.

Application

The SIRIUS compact feeders can be used wherever standard induction motors up to 32 A (approx. 15 kW/400 V) are directly started.

The compact feeders are not suitable for the protection of single-phase AC or DC loads.

Approvals according to IEC, UL, CSA and CCC standards have been issued for the compact feeders.

Low equipment variance

Thanks to wide setting ranges for the rated current and wide voltage ranges, the equipment variance is greatly reduced compared to conventional load feeders.

Very high operational reliability

Through the high short-circuit breaking capacity and defined shut-down when the end of service life is reached means that the SIRIUS compact feeder achieves a very high level of operational reliability that would otherwise have only been possible with considerable additional outlay. This sets it apart from devices with similar functionality.

Safe disconnection

The auxiliary switches (NC contacts) of the 3RA6 compact feeders are designed as mirror contacts. It is thus possible to use the devices for safe disconnection, e.g. emergency-stops, up to Category 2 (EN 954-1) and together with other redundancy switching devices up to Category 3 or 4.

Communications integration through AS-Interface

To enable communications integration through AS-Interface there is an AS-i add-on module available in several versions for mounting instead of the control circuit terminals on the SIRIUS compact feeder.

The design of the AS-i add-on module permits a group of up to 62 feeders with a total of four cables to be connected to the control system. This reduces wiring work considerably compared to the parallel wiring method.

Communications integration using IO-Link

SIRIUS 3RA64, 3RA65 compact feeders for IO-Link see Chapter 7: "IO-Link".

Permanent wiring/easy replacement

Using the SIRIUS infeed system for 3RA6 it is possible to carry out the wiring in advance without a compact feeder needing to be connected.

A compact feeder is very easily replaced simply by pulling it out of the device without disconnecting the wiring.

Even with screw connections or mounting on a standard mounting rail there is no need to disconnect any wiring (on account of the removable main and control circuit terminals) in order to replace a compact feeder.

Consistent solution from the infeed to the motor feeder

The SIRIUS infeed system for 3RA6 with integrated PE bar is offered as a user-friendly possibility of feeding in summation currents up to 100 A with a maximum conductor cross-section of 70 mm^2 and connecting the motor cable directly without additional intermediate terminals.

Screw and spring-type connections

The SIRIUS compact feeders and the infeed system for 3RA6 are available with screw and spring-type terminals.

⊕	Screw terminals
⦾⦾	Spring-type terminals

System configurator for engineering

A free system configurator is available to reduce further the amount of engineering work for selecting the required compact feeders and matching infeed.

Types of infeed for the 3RA6 fuseless compact feeders

On the whole four different infeed possibilities are available:

• Parallel wiring
• Use of three-phase busbars (combination with SIRIUS motor starter protectors and SIRIUS contactors possible)
• 8US busbar adapters
• SIRIUS infeed system for 3RA6

To comply with the clearance and creepage distances demanded according to UL 508 there are the following infeed possibilities:

Overview (continued)

Type of infeed	Feeder terminal (acc. to UL 508, type E)	Type
Parallel wiring	Terminal block for "Self-Protected Combination Motor Controller (Type E)"	**3RV19 28-1H**
Three-phase busbars	Three-phase infeed terminal for constructing "Type E Starters", UL 508	**3RV19 25-5EB**
Infeed systems for 3RA6	Infeed on left, 50/70 mm^2, screw terminal with 3 sockets, outgoing terminal with screw/spring-type connections, including PE bar	**3RA68 13-8AB** (screw terminals), **3RA68 13-8AC** (spring-type terminals)

SIRIUS 3RA6 compact feeders

The SIRIUS 3RA6 compact feeders are universal motor feeders according to IEC 60947-6-2. As control and protective switching devices (CPS) they can connect, convey and disconnect the thermal, dynamic and electrical loads from short-circuit currents up to I_q = 53 kA, i.e. they are practically weld-free. They combine the functions of a motor starter protector, a contactor and a solid-state overload relay in one enclosure. Direct-on-line starters with 45 mm width and reversing starters with 90 mm width are available as versions.

The reversing starter version comes with not only an internal electrical interlock but also with a mechanical interlock to prevent simultaneous actuation of both directions of rotation.

The compact feeders have isolating features in accordance with IEC 60947.2 and can be used as disconnector units (main control switch according to EN 60204 or DIN VDE 0113). Isolation is effected by moving the handle into the "OFF" position; disconnection by means of the control contacts is not enough.

3RA6 fuseless compact feeders are supplied for 5 different current setting ranges. The 3RA61 and 3RA62 have 3 control voltage ranges (AC/DC), the 3RA64 and 3RA65 have one control voltage range (DC):

Current setting range	At 400 V AC for induction motors Standard output *P*	Rated control supply voltage for	
		3RA61, 3RA62 compact feeders	3RA64, 3RA65 compact feeders for IO-Link
A	kW	V AC/DC	V DC
0.1 ... 0.4	0.09	24	24
0.32 ... 1.25	0.37	42 ... 70	
1 ... 4	1.5	110 ... 240	
3 ... 12	5.5		
8 ... 32	15		

Note:

The 3RA1 load feeders can be used for fuseless load feeders > 32 A up to 100 A.

The SENTRON 3VL circuit breakers and the SIRIUS 3RT contactors can be used for fuseless load feeders >100 A.

Operating conditions

The SIRIUS 3RA6 compact feeders are suitable for use in any climate. They are intended for use in enclosed rooms in which no severe operating conditions (such as dust, caustic vapors, hazardous gases) prevail. Suitable covers must be provided for installation in dusty and damp locations.

The SIRIUS compact feeders are generally designed to degree of protection IP20. The permissible ambient temperature during operation is -20 to +60 °C.

The rated short-circuit current I_{CS} according to IEC 60947-6-2 is 53 kA at 400 V.

Note:

The maximum permissible short-circuit currents of the device versions for the various forms of power supply and voltages are available on request from Technical Assistance:
Tel.: +49 (9 11) 8 95-59 00
E-mail: technical-assistance@siemens.com.

Overload tripping times

The overload tripping time can be set on the device to normal starting conditions (CLASS 10) and to heavy starting conditions (CLASS 20). As the breaker mechanism still remains closed after an overload, resetting is possible by either local manual reset or auto reset after 3 minutes cooling time.

With autoreset there is no need to open the control cabinet.

Diagnostics options

The compact feeder provides the following diagnostics options:
- With LEDs
  - Connection to the control voltage
  - Position of the main contacts
- With mechanical indication
  - Tripping due to overload
  - Tripping due to short circuit
  - Tripping due to malfunction (end of service life reached because of worn switching contacts or a worn switching mechanism or faults in the control electronics)

These states can also be evaluated in the higher-level control system:
- With parallel wiring using the integrated auxiliary and signaling switches of the compact starter
- With AS-Interface or IO-Link in even greater detail using the respective communication interface

Four complement versions for 3RA6 compact feeders

- For standard mounting rail or screw fixing: basic version including 1 pair of main circuit terminals and 1 pair of control circuit terminals
- For standard mounting rail or screw fixing when using the AS-i add-on module: without control circuit terminals because the AS-i add-on module is plugged on instead
- For use with the infeed system for 3RA6: without main circuit terminals because they are supplied with the infeed system and the expansion modules
- For use with the infeed system for 3RA6 and the AS-i add-on module: without terminal complement (also for reordering when replacing the compact starter)
- The control circuit terminals are always required by the compact starters for IO-Link; the main circuit terminals depend on the use of the infeed system.

More components of the 3RA6

Already integrated in the 3RA61/3RA62 – and connectable using the two 6-pole removable control circuit terminals – in addition to the control supply voltage are the signaling contacts "overload" (1 CO) and "short circuit / malfunction" (1 NO). The 3RA61 has two auxiliary contacts (1 NO + 1 NC) for indicating the position of the main contacts. Unlike the 3RA61 direct-on-line starter, the 3RA62 reversing starter has one auxiliary contact (1 NO) per direction of rotation per main contact.

6

AS-Interface slaves
Motor starters for operation in the control cabinet

SIRIUS 3RA6 compact feeders
General data

■ **Overview** (continued)

Available for the 3RA61 and 3RA64 direct-on-line starters is a slot for an optional auxiliary switch block (optionally 2 NO, 2 NC or 1 NO + 1 NC) and for the 3RA62 and 3RA65 reversing starters there are two slots (for auxiliary switch blocks see "Accessories" on Page 6/84).

Unlike the direct-on-line starter, the 3RA62 reversing starter has one auxiliary contact (1 NO) per direction of rotation per main contact.

Positively-driven operation of the auxiliary contacts

Positively-driven operation between individual auxiliary circuits exists for the compact feeder in the version as a direct-on-line starter for parallel wiring (3RA61) between the auxiliary circuits of the NC contacts (NC 21-22) and the NO contacts (NO 13-14) in the basic unit.

In addition the optional auxiliary switch block offers positively driven contacts in the version 3RA69 13-1A, each with one NC contact and one NO contact.

■ **Benefits**

The SIRIUS 3RA6 compact feeders offer a number of benefits:

- Compact design saves space in the control cabinet
- Little planning and assembly work and far less wiring thanks to a single complete unit with one order number
- Little variance through 3 wide voltage ranges and 5 wide setting ranges for the rated current mean low stock levels
- High plant availability through integrated functionalities such as prevention of main contact welding and shut-down at end of service life
- Greater productivity through automatic device reset in case of overload and differentiated detection of overload and short-circuit
- Easy checking of the wiring and testing of the motor direction prior to start-up thanks to optional "control kits"

- Speedy replacement of devices thanks to removable terminals with spring-type and screw connections in the main and control circuit
- Efficient power distribution through the related SIRIUS infeed system for 3RA6
- Direct connection of the motor feeder cable to the SIRIUS infeed system for 3RA6 thanks to integrated PE bar
- Connecting and looping through incoming feeders up to a cross-section of 70 mm^2
- When using the infeed system for 3RA6, possibility of directly connecting the motor cable without intermediate terminals
- Integration in Totally Integrated Automation thanks to the optional connection to AS-Interface or IO-Link

The SIRIUS 3RA6 compact feeders create the basis for high-availability and future-proof machine concepts.

■ **Overview**

Accessories for SIRIUS 3RA6 compact feeders

The following accessories are available specially for the 3RA6 compact feeders:

- AS-i add-on module:
  see from Page 6/88 "AS-interface add-on modules"
- External auxiliary switch blocks: Snap-on auxiliary switch as versions 2 NO, 2 NC and 1 NO + 1 NC with screw or spring-type connections; the contacts of the auxiliary switch block open and close jointly with the main contacts of the compact feeder. The NC contacts are designed as mirror contacts.
- Control kit: aid for manually closing the main contacts in order to check the wiring and motor direction under conditions of short-circuit protection
- Adapter for screw fixing the compact feeder, including push-in lugs
- Main circuit terminals: Available with screw and spring-type terminals
- Main circuit terminals mixed connection method:
  With the main circuit terminals mixed connection method it is also possible in the main circuit to switch from screw terminals on the line side to spring-type terminals on the outgoing side. This enables for example the side-by-side mounting of several compact feeders and their cost-efficient connection using 3-phase busbars on the infeed side. The motors are then connected directly by the quick and reliably contacting spring-type connection method.

Accessories for UL applications

The terminal block for "Self-Protected Combination Motor Controller", type E is available for complying with the clearance and creepage distances demanded according to UL 508.

Accessories for infeed using three-phase busbar systems

The three-phase busbars can be used as an easy, time-saving and clearly arranged means of feeding SIRIUS 3RA6 compact feeders with screw connection. Motor starter protector sizes S00 and S0 can also be integrated.

The busbars are suitable for between 2 and 5 devices. However, any kind of extension up to a maximum summation current of 63 A is possible by clamping the tags of an additional busbar (rotated by 180°) underneath the terminals of the respective last motor starter protector.

A connecting piece is required for the combination with 3RV1 motor starter protector size S00. Motor starter protectors S00 and S0 of the 3RV2 series can be combined in any way (without a special connecting piece). The motor starter protectors are supplied by appropriate feeder terminals. Special feeder terminals are required for constructing "Type E Starters" according to UL/CSA.

The three-phase busbar systems are finger-safe but empty connection tags must be fitted with covers. They are designed for any short-circuit stress which can occur at the output side of connected SIRIUS 3RA6 compact feeders or motor starter protectors.

Busbar adapters for 60 mm systems

The compact starters are mounted directly with the aid of busbar adapters on busbar systems with 60 mm center-to-center clearance in order to save space and to reduce infeed times and costs. These feeders are suitable for copper busbars with a width from 12 to 30 mm. The busbars can be 4 to 5 mm or 10 mm thick.

The 8US busbar system can be loaded with a maximum summation current of 630 A.

The "reversing starter" version requires a device holder along side the busbar adapter for lateral mounting.

The compact feeders are snapped onto the adapter and connected on the line side. This prepared unit is then plugged directly onto the busbar system, and is thus connected both mechanically and electrically at the same time.

Note:

For more accessories such as incoming and outgoing terminals, flat copper profiles etc., see Catalog LV 10.1.

Accessories for operation with closed control cabinet doors

Door-coupling rotary operating mechanisms for standard and emergency-stop applications are available for operating the compact feeder with closed control cabinet doors.

AS-Interface slaves
Motor starters for operation in the control cabinet

SIRIUS 3RA6 compact feeders
Add-on modules for AS-Interface

■ Overview

Various AS-i add-on modules are available for communication of the 3RA6 compact feeder with the control system using AS-Interface:

- Standard version
- With two local inputs
- With two free external inputs
- With one free external input and one free external output
- With two free external outputs
- For local control

The AS-i add-on modules can be combined only in connection with compact feeders with a rated control supply voltage of 24 V AC/DC.

AS-i add-on module for on-site controller

With this new module it is also possible for the connected compact feeder to be operated directly using simple switches, i.e. without recourse to AS-i Communication, if required.

"Automatic" mode

NC contacts can be connected to the inputs Y2 and Y4 through the local terminals on the AS-i add-on module. If the "+" connections are connected simultaneously to both local inputs, the AS-i add-on module will be in "Automatic" mode, i.e. it will communicate with the control system through AS-Interface.

On-site control

Opening the two inputs Y2 and Y4 will result in the direct disconnection of the compact feeder. Operation through AS-i Communication is ended and the compact feeder can now be switched on and off directly using NO contacts (one NO contact per direction of rotation on the reversing starter).

"LED AUX Power" must light up green, the 24 V DC supply must be assured and the AS-i control supply voltage must no longer be applied.

Resetting to "Automatic" mode

Simultaneous application of a "1" signal at the local inputs. The availability bit DI 0 is switched to a "1" signal.

If AS-i Communication is reset, the motor is first switched off and then on again when requested by the control system.

Switch with 3 switch positions

Motor starters for operation in the control cabinet

SIRIUS 3RA6 compact feeders
Infeed system for 3RA6

■ Overview

The infeed system for 3RA6 compact feeders enables far less wiring in the main circuit and, thanks to the easy exchangeability of the compact feeders, reduces the usual downtimes for maintenance work during the plant's operating phase.

The infeed system provides the possibility of completely pre-wiring the main circuit without a compact feeder needing to be connected at the same time. As the result of the removable terminals in the main circuit, compact feeders can be integrated in an infeed system in easy manner (without the use of tools).

In addition, the integrated PE bar means it is optionally possible to connect the motor cable directly to the infeed system without additional intermediate terminals. The infeed system for 3RA6 compact feeders is designed for summation currents up to 100 A with a maximum conductor cross-section of up to 70 mm² on the feeder terminal block.

The infeed system can be mounted on a standard mounting rail or flat surfaces.

①	Feeder terminal	⑦	PE pick-off

Infeed system for 3RA6 compact feeders

AS-Interface slaves
Motor starters for operation in the control cabinet

SIRIUS 3RA6 compact feeders
Infeed system for 3RA6

Overview (continued)

① *Infeed*

The 3-phase infeed is available with screw connection (25/35 mm^2 up to 63 A or 50/70 mm^2 up to 100 A) and spring-type connection (25/35 mm^2 up to 63 A).

The infeed with spring-type terminal can be fitted on the left as well on as the right to an expansion module.

The infeed with screw terminal is supplied only with a 3-socket expansion module and permanently fitted on the left side.

The infeeds with screw connection enable connection of the main conductors (L1, L2, L3) either from above or from below.

The infeed with screw connection is supplied complete with 1 end cover, the infeed with spring-type connection complete with 2 end covers.

② *Three-socket expansion modules*

The expansion module with 3 sockets for compact feeders is available with screw connection and with spring-type connection.

Expansion modules enable the infeed system to be expanded and can be fitted to each other in any number.

Two expansion modules are held together with the help of 2 connecting wedges and 1 expansion plug. These assembly parts are included in the scope of supply of the respective expansion module.

When the infeed system for 3RA6 is used, the compact feeders (plug-in modules) are easily mounted and removed even when live.

Optional possibilities:
- PE connection on motor outgoing side
- Outfeed for external auxiliary devices
- Connection to 3RV19 infeed system
- Integration of SIRIUS 3RV1 motor starter protectors size S0 (using 3RA68 90-0BA adapter)

③ *Two-socket expansion modules*

If only 2 instead of 3 additional sockets are required, then the 2-socket expansion module is the right choice. It has the same functionality as the 3-socket expansion module.

④ *Expansion plug*

Two expansion modules can be connected together using the expansion plug. Flexible expansion of the infeed system is thus possible.

⑤ *PE infeeds*

This module enables a PE cable to be connected.

The PE infeed can be ordered with screw connection and spring-type connection (35 mm^2) and can be fitted on the right or left to the expansion block.

⑥ *PE expansion plug*

The PE expansion plug is inserted from below and enables two PE bars to be connected.

⑦ *PE pick-off*

The PE pick-off is available with screw connection and spring-type connection (6/10 mm^2). It is snapped into the infeed system from below.

⑧ *Connecting wedges*

Two connecting wedges are used to hold together 2 expansion modules.

⑨ *End covers*

On the last expansion module of a row, the socket provided for the expansion plug can be covered by inserting the end cover.

⑩ *45 mm adapters for SIRIUS 3RV1 motor starter protectors*

SIRIUS 3RV1 motor starter protectors size S0 with screw connection can be fitted to the adapter, enabling them to be plugged into the infeed system.

IP20 terminal covers for increasing finger-safety

Universally configured terminal covers are available for the 3-phase infeeds with screw connection 25/35 mm^2 and 50/70 mm^2:

- 3RA68 80-2AB terminal covers for infeeds with screw connection 25/35 mm^2 (3RA68 12-8AB/AC)
- 3RA68 80-3AB terminal covers for infeed with screw connections 50/70 mm^2 (3RA68 13-8AB/AC)

The terminal covers can be used in two ways on the feeder terminals of the infeeds with screw connection 25/35 mm^2 and 50/70 mm^2 (see illustration):

- If the terminals are connected, the cables are also covered:
  - by approx. 14 mm with the 3RA68 80-2AB
  - by approx. 18 mm with the 3RA68 80-3AB
- On clamping points without connected cables, the covers can be turned once and then pushed over the clamping points for finger-safe covering of the metal parts.

Use of the 3RA68 80-2AB terminal cover on the infeed with screw connection 25/35 mm^2 (3RA68 12-8AB/AC). The upper cover increases the finger-safety for the connected conductors. The identical lower cover is turned for use and prevents touching of the voltage-carrying metal parts of the feeder terminal.

Terminal blocks

Using the terminal block the 3 phases can be fed out of the system; this means that single-phase, two-phase and three-phase components can also be integrated in the system.

After the end cover is pulled out, the terminal block can be plugged onto an expansion module.

Expansion plug for SIRIUS 3RV19 infeed systems

After the end cover is pulled out, the expansion plug for the SIRIUS 3RV19 infeed system can be plugged onto an expansion module. It connects the infeed system for 3RA6 compact feeders with the SIRIUS 3RV19 infeed system.

6

AS-Interface slaves
Motor starters for operation in the control cabinet

SIRIUS 3RA6 compact feeders
Infeed system for 3RA6

■ **Overview** (continued)

Maximum rated operational current

The following maximum rated operational currents apply for the components of the infeed system for 3RA6:

Component	Maximum rated operational current
	A
Infeed with screw connection 50/70 mm²	100
Infeed with screw connection 25/35 mm²	63
Infeed with spring-type connection 25/35 mm²	63
Expansion plug	63

With side-by-side mounting of several expansion modules, the maximum rated operational current from the second expansion module to the end of the row is 63 A.

Proposal for upstream short-circuit protection devices

The following short-circuit data apply for the components of the infeed system for 3RA6 compact feeders:

Conductor cross-section mm²	Inscriptions	Proposal for upstream short-circuit protection device
Short-circuit protection for infeed block (25 mm²/35 mm²) with screw connection		
2.5 ... 35	$I_{d, max}$ = 19 kA, I^2t = 440 kA²s	**3RV10 41-4JA10**
Short-circuit protection for infeed block (50/70 mm²) with screw connection		
2.5 ... 70	$I_{d, max}$ = approx. 22 kA	**3RV10 41-4MA10**
Short-circuit protection for infeed block with spring-loaded connection		
4	$I_{d, max}$ = 9.5 kA, I^2t = 85 kA²s	**3RV10 21-4DA10**
6	$I_{d, max}$ = 12.5 kA, I^2t = 140 kA²s	**3RV10 31-4EA10**
10	$I_{d, max}$ = 15 kA, I^2t = 180 kA²s	**3RV10 31-4HA10**
16/25	$I_{d, max}$ = 19 kA, I^2t = 440 kA²s	**3RV10 41-4JA10**
Short-circuit protection for terminal block		
1.5	$I_{d, max}$ = 7.5 kA	**5SY...**
2.5	$I_{d, max}$ = 9.5 kA	[1]
4	$I_{d, max}$ = 9.5 kA	
6	$I_{d, max}$ = 12.5 kA	

[1] To prevent the possibility of short-circuits, the cables on the terminal block must be installed so that they are short-circuit proof according to EN 60439-1 Section 7.5.5.1.2.

Overview

SIRIUS M200D AS-i Basic motor starters with manual on-site operation

The intelligent, highly flexible SIRIUS M200D motor starters for distributed configurations are designed to start, monitor and protect motors and loads up to 5.5 kW.

The M200D motor starters are available in four versions:

M200D AS-i Basic	M200D AS-i Standard	M200D PROFIBUS	M200D PROFINET
Motor control with AS-i Communication		PROFIBUS	PROFINET
Mechanical or electronic switching			
✓	✓	✓	✓
Electronic switching with soft starter functionality			
--	✓	✓	✓

✓ Function is available

-- Function is not available

Basic functionality

All M200D motor starter versions have the following functions:

- Available as direct-on-line and reversing starters in a rugged design
- Electromechanical or solid-state switching version
- Little variance – only 2 device versions up to 5.5 kW thanks to wide range setting
- All versions have the same enclosure dimensions
- Degree of protection IP65
- Quick and failsafe wiring of system and motor cables using ISO 23570 plug-in connector technology (Q4/2 and Q8/0)
- Robust and widely used M12 connection method for digital inputs and outputs
- Integrated feeder connector monitoring
- Full motor protection through overload protection and a temperature sensor (PTC, TC)
- Short-circuit and overload protection integrated
- Integrated repair switch lockable with 3 locks (multi-level service)
- Uniform wiring to the G110D/G120D frequency converters and to the ET 200pro distributed peripherals system
- Extensive diagnostics concept using LEDs
- Optional integrated manual on-site controller with key-operated switch (ordering option)
- Optionally available brake actuation with voltages from 180 V DC (no rectifier needed in motor) or 230/400 V AC (order versions)

Benefits

M200D motor starters provide the following advantages for customers:

- High plant availability through plug-in capability of the main circuit, communication and IOs – relevant for installing and replacing devices
- Cabinet-free construction and near-motor installation thanks to the high degree of protection IP65
- The motor starters record the actual current flow for the parameterizable electronic motor overload protection. Reliable messages concerning the overranging or underranging of setpoint values for comprehensive motor protection. All motor protection functions can be defined by simple parameterization
- Low stock levels and low order costs through a wide setting range for the current or a wide setting range for the electronic motor protection of 1:10 (only 2 device versions up to 5.5 kW)
- The integrated wide range for the current enables a single device to cover numerous standard motors of different sizes

- Comprehensive offering of accessories, including ready-assembled cables
- The M200D motor starters can be installed with a few manual steps The integrated plug-in technology significantly reduces the wiring outlay:
  preassembled cables can be plugged directly onto the motor starter module
- Easy and user-friendly installation because all versions have the same enclosure dimensions
- Fast and user-friendly commissioning using an optional manual on-site controller
- Increase of process speed through integrated functions such as "Quick-Stop" and "Disable Quick-Stop", e.g. at points and crossings
- Optional manual on-site controller with momentary-contact and latching operation for easier start-up and easier service

Application

The high degree of protection IP65 makes the M200D motor starters suitable in particular for use on extensive conveying systems such as are found in mail sorting centers, airports, automotive factories and the packing industry.

For simple operating mechanism tasks, particularly in conveyor applications, the new SINAMICS G110D frequency converter series with a performance range from 0.75 kW to 7.5 kW and degree of protection IP65 is the ideal partner for the M200D motor starters.

The SINAMICS G110D frequency converters permit continuous speed control of three-phase asynchronous motors and meet the requirements of conveyor applications with frequency control (for more information, see Catalog D 11.1 "SINAMICS G110, G120 ...").

AS-Interface slaves
Motor starters for operation in the field, high degree of protection

SIRIUS M200D motor starters
M200D motor starters for AS-Interface

■ Overview

For motor control using AS-Interface there are the following M200D motor starter versions: SIRIUS M200D AS-i Basic and SIRIUS M200D AS-i Standard (for details of basic functionality see Page 6/97 "M200D motor starters" --> "General data" --> "Overview").

SIRIUS M200D AS-i Basic

Functionality

- Easy and fast on-site start-up through parameterization of local setting elements (DIP switches) and rotary coding switches for adjusting the rated operational current. The rotary coding switch has an OFF position for deactivating the overload protection with the help of the thermal motor model when using a temperature sensor.

Communication

- AS-i communication with A/B addressing according to Spec V2.1

- The AS-i bus is connected cost-effectively using an M12 connection on the device. Of the 4 digital inputs, 2 are contained in the process image and can therefore be used in the PLC program. The other 2 inputs are locally effective and permanently assigned with functions.

- The LEDs can provide comprehensive diagnostics of the device on the spot. In addition to diagnostics using the PAE process image, the device can create up to 15 different diagnostic signals per slave. The message with the highest priority can be read out through the AS-i communication. This is yet another new development which distinguishes the M200D AS-i Basic motor starter from the rest of the market and adds innovative technology, maximum availability and transparency to the system.

SIRIUS M200D AS-i Standard

The intelligent, highly flexible M200D AS-i Standard motor starters in A/B technology are designed to start and protect motors and loads up to 5.5 kW. They are available in direct-on-line or reversing starter versions, in a mechanical version and also an electronic version (the latter with soft start function).

The M200D AS-i Standard motor starter is the most functional member of the SIRIUS motor starter family in the high degree of protection IP65 for AS-i Communication. Consistency with other products of the SIRIUS M200D motor starter range and with the frequency converter and ET 200pro peripherals system is assured.

Functionality

- AS-i communication with A/B addressing according to Spec 3.0

- Electronic version also with soft start function

- AS-i slave profile 7AE/7A5 with process image 6I/4O

- Full TIA integration: All digital inputs and outputs exist in the cyclic process image and are visible through AS-i, providing maximum flexibility and best adaptability to the application.

- Additionally expanded diagnostics using data record through AS-i bus

- Complete plant monitoring using statistics data record and current value monitoring by means of data records

- Parameterization through AS-i bus with the help of data records or an expanded process image from the user program

- Control of the motor starter using a command data record from the user program

- Flexible assignment of the digital inputs and outputs with all available assignable input actions

- Parameterization using Motor Starter ES at the local interface (ordering option for start-up software)

- Diagnostics with the help of Motor Starter ES (ordering option for start-up software)

Mounting and installation

The M200D motor starters can be installed with a few manual steps. The integrated plug-in technology enables far lower wiring outlay. Connecting cables can be plugged directly onto the motor starter module. Swapping of the connecting wires and malfunctions within the plant are prevented by preassembled cables. The AS-i bus is connected cost-effectively using an M12 connection on the device. All versions have identical enclosure dimensions for easier system configuration and conversion.

Parameterization and configuration

The particularly robust M200D AS-i Standard motor starter is characterized by numerous functions which can be flexibly parameterized. It enables highly flexible parameterization through the AS-i bus using data records from the user program as well as user-friendly local parameterization using the Motor Starter ES start-up software through the local point-to-point interface.

Functions can be flexibly assigned to the digital inputs and outputs, adapting them to all possible conveyor applications. All motor protection functions, limit values and reactions can be defined by parameterization. The AS-i Standard is unique. In its 6I/4O process image the motor starter sends all 4 digital inputs and the digital output via the process image to the PLC in cyclic mode. System configuration and system documentation are facilitated not least by a number of CAX data.

Operation

The new motor starter generation is characterized by high functionality, maximum flexibility and the highest level of automation.

All digital inputs and outputs exist in the cyclic process image. All limit values for monitoring functions and their reactions are parameterizable and therefore adaptable to the application. The motor starters record the actual current flow. Evaluating the current of the parameterizable solid-state overload protection increases the availability of the drives, as do reliable messages concerning the overranging or underranging of setpoint values.

Diagnostics and maintenance

The M200D sets new standards for diagnostics. In addition to diagnostics using the PAE process image and diagnostics by "parameter echo" (up to 15 different diagnostic signals per slave can be read out via AS-i Communication), the possibility of reading out diagnostic data records is unique on the market.

The AS-i Standard is recommended in particular for expansive and highly automated plant parts because the possibility of monitoring devices and systems with data records (statistical data, measured values and device diagnostics) provides an in-depth view of the plant from the control room, guaranteeing the monitoring process and increasing plant availability.

The integrated maintenance timer can be used to implement preventative maintenance and avoid plant downtimes through look-ahead servicing.

Local on-site control of a drive is possible using the ordering option with integrated manual operation. This is yet another new development which distinguishes the M200D AS-i Standard motor starter from the rest of the market and adds innovative technology, maximum availability and transparency to the plant.

■ **Application**

The M200D AS-i standard is particularly suitable for highly auto-mated applications in conveyor systems, which require that de-vices and plants be monitored to prevent or limit plant downtime. The option of planning the functions of the motor starter or its in-terfaces also makes fine-adjustment to the function of the motor starter in the application possible and hence, provides for ex-treme flexibility.

	• For setting the AS-i address of standard slaves, and slaves with extended
	  addressing mode (A/B slaves)
	• With input/output test function and many other -commissioning functions
	• Battery operation with 4 batteries type AA (IEC LR6, NEDA 15)
	• Scope of supply:
	  - Addressing unit with 4 batteries
	  - Addressing cable, with M12 plug to addressing plug
	    (hollow plug), length 1.5 m
		3RK1 904-2AB02

3RK1 902-4PB15-3AA0	**M12 addressing cables to M12** • Standard M12 cable for addressing slaves with M12 connection, e.g. K60R modules • When using the current version of the 3RK1 904-2AB01 addressing unit • 1.5 m	**3RK1 902-4PB15-3AA0**

Portfolio of the SIRIUS 3RK43 MCU motor starter family

The SIRIUS MCU motor starter family (MCU = Motor Control Unit) rounds off the bottom end of the SIRIUS motor starter range.

This series of motor starters in a high degree of protection is a system solution for the cabinet-free controlling of AC loads in the field.

The MCU product range extends from I/O-controlled motor starters – addressing a central sub-distribution board via I/O stations – in a plastic enclosure for simple applications to motor starters with AS-i communication in a rugged metal enclosure for demanding tasks. (For full range, see Catalog IC 10 --> Motor starters for operation in the field, high degree of protection)

The MCU motor starters are completely pre-wired inside, have a high degree of protection and are designed for switching and protecting any AC loads. They are mostly used on standard induction motors in direct or reversing duty up to 5.5 kW at 400/500 V AC (electromechanical switching) and 400/460 V AC (electronic switching).

The motor and short-circuit protection integrated in the MCUs consists either of an electromechanical controlgear assembly or solid-state overload protection and a motor starter protector unit for short-circuit protection.

MCUs with metal enclosure are designed for the switching of induction motors. Integrated control of the electrically operated motor brake with a braking voltage of 230 V AC or 400 V AC is a standard feature. The braking voltage is routed to the motor over the motor cable.

SIRIUS MCU motor starters have the following main features:

- Direct-on-line or reversing starters
- Up to 5.5 kW
- High degree of protection, namely IP55 on MCU motor starters in a plastic enclosure and IP54 on motor starters in a metal enclosure, enables distributed configurations in the field and saves space in the control cabinet
- Electromechanical or electronic switching
- Easy and user-friendly control and monitoring through AS-Interface bus communication
- Controlled stopping through brake control 230 V AC or 400 V AC for motor brake
- Integrated lockable repair switch
- Comprehensive motor protection thanks to integrated overload and short-circuit protection with SIRIUS 3RV motor starter protectors or integrated solid-state overload relays (solid-state starters)
- Overload protection with thermal release (bimetal) or solid-state overload relay with wide range setting
- Power and load connection by means of an M screw

- Main power loop possible (daisy chain; max. $2 \times 6 \text{ mm}^2$)
- Robust and widely used M12 connection method for digital inputs and outputs to connect I/O stations and the AS-i bus connection increase flexibility and prevent errors in the system configuration.
- The LEDs (for AS-i bus connection) can provide comprehensive diagnostics of the device on the spot.
- Simple mounting for AS-i and external auxiliary voltage (24 V DC) over an M12 connection
- Manual operation: An integrated key-operated switch "MAN-0-AUTO" and a selector button for switching on, switching off and changing the direction of rotation for control purposes during commissioning or maintenance

MCU motor starters with AS-i bus connection in a plastic enclosure

This motor starter version offers an economical solution for controlling and monitoring conveyor belts, pumps, fans or compressors.

On this MCU the control commands and the status queries are sent over the AS-i bus. The yellow cable (bus) and the black AS-i cable for 24 V DC AUX are connected through a M12 plug.

The transparent enclosure top permits monitoring of the status LEDs. These MCUs come completely pre-wired inside.

MCU motor starters with AS-i bus connection in a metal enclosure for electromechanical or electronic switching

These MCUs with their rugged metal enclosure in degree of protection IP54 are ideal in particular for controlling and monitoring induction motors in harsh ambient conditions such as are often found in conveyor systems.

A special feature of this version is the manual local operation of the motor starter.

The key-operated switch "MAN-0-AUTO" for selecting Manual, 0 or Automatic mode prevents unauthorized changes of operating mode. In automatic mode the MCU is controlled through the AS-i bus.

In manual mode a selector button is used for switching on, switching off and changing the direction of rotation.

The status/diagnostics LEDs fitted to the cover indicate the current operating state of the motor starter.

Unlike the electromechanical starter, the solid-state motor starter has wear-free solid-state switching devices which guarantee a high switching frequency.

Another highlight of the electronic switching version is the solid-state overload relay for motor protection, which has a wide setting range for the motor current.

MCU motor starters for AS-Interface
Plastic enclosures, electromechanical switching

Overview

MCU for AS-i, plastic enclosure

- Direct-on-line or reversing starters up to 12 A at 400 V AC (50/60 Hz)
- Repair switches (black/gray) lockable with padlocks (max. 3 units)
- Integrated overload and short-circuit protection with SIRIUS 3RV motor starter protectors Class 10 with short-circuit breaking capacity I_{cu} = 50 kA at 400 V AC
- Overload protection with thermal release (bimetal)
- Transparent plastic enclosure with LED status displays for monitoring the AS-i status
- Degree of protection IP55
- Cable connections by means of M screws
- Main power loop possible (daisy chain; max. 2 x 6 mm^2)
- AS-Interface through M12 plug-in terminal
- 4 x M20 glands enclosed
- Communication: AS-Interface 2I/2O (standard slaves)

① Main control switch / repair switch
② Load outgoing feeder through M screw
③ Main incoming power supply through M screw (max. 6 mm^2)
④ Main power loop possible (daisy chain)
⑤ AS-i communication / U_{aux} (24 V DC) through M12 plug

(position of outgoing units as example – outgoing units are possible on all sides)

MCU for AS-i, plastic enclosure

AS-Interface slaves
Motor starters for operation in the field, high degree of protection

Motor starters for AS-Interface, 24 V DC
General data

■ Overview

Connection of an actuator roller with integrated DC motor to an
AS-Interface 24 V DC motor starter

With the K60 AS-Interface 24 V DC motor starters for the low-end performance range up to 70 W, it is now possible to connect 24 V DC motors and the associated sensors directly to the AS-Interface quickly and easily.

Three different versions are available:

- Single direct-on-line starters (without brake and reversible quick-stop function)
- Double direct-on-line starters (with brake and reversible quick-stop function)
- Reversing starters (with brake and reversible quick-stop function)

DC motors are connected to the module using M12 plug-in connections. The sensors and the module electronics can be supplied from the yellow AS-Interface cable. An auxiliary voltage (24 V DC) is only required for supplying the outputs, which can be provided via the black AS-Interface cable.

Quick-stop function

All AS-Interface 24 V DC motor starters feature a quick-stop function which can be switched on and off as required using a switch integrated into the module. The quick-stop function allows a connected motor to be disconnected immediately using an applied sensor signal (High). The switch for the quick-stop function is located alongside the input sockets and is protected by an M12 sealing cap.

Brake

The double direct-on-line starter and the single reversing starter versions feature an integrated permanently set brake function, i.e. as soon as the output signal is set to "0", the motor is braked.

Start-up using integrated buttons

Buttons integrated into the module (below the output sockets) can be used to set the motor used. The buttons are protected by an M12 sealing cap.

Note concerning double and reversing starters:

If an input with the quick-stop function receives a "High" signal, the corresponding output (e.g. quick-stop input 1 –> output 1) is switched off within the device (the motor is braked). The manual key function (Key 1/2) for local operation is only permitted to be used during "CPU Stop" in the higher-level PLC.

Note concerning single direct-on-line starters:

If an input with the quick-stop function receives a "High" signal, the corresponding output (e.g. quick-stop input 1 –> output 1) is switched off within the device (the motor runs down without being braked) The manual key function (Key 1) for local operation is only permitted to be used and defined during "CPU Stop" in the higher-level PLC.

Overview (continued)

Applications

Single direct starter without brake (with adjustable quick-stop function)

1st possibility: Connection to a maximum of four sensors without pollution indication

2nd possibility: Connection to a maximum of two sensors with pollution indication

Double direct starter with brake (with adjustable quick-stop function)

1st possibility: Connection to a maximum of four sensors without pollution indication

2nd possibility: Connection to a maximum of two sensors with pollution indication

Single reversing starter with brake (with adjustable quick-stop function)

1st possibility: Connection to a maximum of four sensors without pollution indication

2nd possibility: Connection to a maximum of two sensors with pollution indication

Overview

The new distributed frequency converter series SINAMICS G110D is the solution for demanding drive applications, particularly in the field of conveyor applications. The converter permits continuous speed control of three-phase asynchronous motors and meets the requirements of conveyor applications with frequency control. With its compact and flat design in IP65 degree of protection, it slots into the system optimally. The drive can be excellently linked into the Siemens TIA automation world using AS-Interface.

With its large performance range from 0.75 kW to 7.5 kW it is suitable for numerous distributed drive solutions.

Example: SINAMICS G110D size FSA

Reasons for distributed drive technology

- Modular drive solutions – and thus standardized mechatronic elements that can be tested individually
- Control cabinets are dispensed with, meaning that less space and cooling are required
- Long motor cables are dispensed with between converter and motor (less power loss, lower interference emissions and lower costs for shielded cables and additional filters)
- For conveyor applications with their large spatial range (e.g. in the automotive and logistics industries), the distributed installation methods bring great benefits

Siemens distributed drive family

For optimal realization of distributed drive solutions, Siemens offers an innovative range of frequency converters. The strengths of the individual family members permit a simple adaptation to extremely varied application requirements:

- Identical connection technology
- Identical installation dimensions of SINAMICS G110D and SINAMICS G120D
- Uniform commissioning and configuration tool

Products of the distributed drives family:

- SINAMICS G110D frequency converters
- SINAMICS G120D frequency converters
- SIMATIC ET 200S FC frequency converters
- SIMATIC ET 200pro FC frequency converters
- SIRIUS M200D motor starters

Device configuration

SINAMICS G110D is a compact converter in IP65 degree of protection which integrates the control unit (CU) and power module (PM) function units into a single device.

The control electronics controls and monitors the power electronics and the connected motor in several selectable control types. The digital and analog inputs on the device permit the simple wiring of sensors directly to the drive. The input signals can either be connected directly within the control unit and trigger autonomous local reactions, or they are passed to a central control system via AS-Interface where they are processed in the context of the system as a whole.

The power electronics supply the motor in a performance range from 0.75 kW to 7.5 kW. They are controlled by the microprocessor of the control system. For extremely reliable and flexible motor operation, the latest IGBT technology with pulse width modulation is used. Comprehensive protection functions provide a high degree of protection for the frequency converter and motor. The unusually flat mechanical design is optimized for use direct in the system. The compact frequency converter has the same hole dimensions for all powers (constant "footprint") and the dimensions are also identical to those of the SINAMICS G120D frequency converter. This makes the design, installation and conversion of the system considerably easier.

Up-to-date technical documentation (catalogs, dimensional drawings, certificates, manuals and operating instructions) are available on the Internet at:
www.siemens.com/sinamics-g110d/documentation
and offline on the DVD-ROM CA 01 in the DT configurator. In addition, the DT configurator can be used on the Internet without installation. The DT configurator can be found in the Industry Mall at the following address:
www.siemens.com/dt-configurator

STARTER commissioning tool

The STARTER commissioning tool (from V4.1.3) makes the commissioning and maintenance of the SINAMICS G110D converter easier. It offers operator prompting for quick and easy commissioning, combined with user-friendly and comprehensive functions for the drive solution.

6

AS-Interface slaves
SINAMICS G110D distributed frequency converters

General data

■ **Benefits**

- Wide performance range from 0.75 kW to 7.5 kW
- Rapid commissioning and maintenance thanks to expanded diagnostics functions and communication capability with AS-Interface in accordance with Specification 3.0
  - Reduction of interfaces
  - System-wide engineering
  - Simple handling
- The design, installation and conversion of the system are made much easier by the compact and space-saving design with its very flat form and identical hole dimensions for all powers; the dimensions are also identical to those of the SINAMICS G120D converter.
- Simple commissioning and maintenance thanks to identical, standardized plug-in connections for the bus, power and I/O connections (ISO 23570) over the entire performance range of the SINAMICS G110D and SINAMICS G120 D frequency converters.
- Use of the same plug for SIRIUS M200D motor starter
- Simple, consistent realization of complete, distributed system concepts by the scalable use of the products:
  - SIRIUS M200D (motor starters)
  - SINAMICS G110D
    (converters for simple conveyor applications)
  - SINAMICS G120D
    (converters for demanding conveyor applications)
- Very user friendly thanks to the use of the Intelligent Operator Panel (IOP) for parameterization, diagnostics and control and for the copying of drive parameters in the BOP
- Easy replacement thanks to plug-in connections and excellent ease of maintenance thanks to the use of a memory card
- Simple connection, configuration, data storage and control of the converter in complex systems by consistent integration into TIA (Totally Integrated Automation)

- Thanks to the optional maintenance switch it is easy to disconnect the converter from the network for servicing without having to provide for additional components or additional wiring outlay during configuration.
- The optional manual on-site operation allows rapid spatially restricted commissioning, manual pre-testing of the application on site and validation running to be performed without expensive options
- Thanks to the option of the direct connection of up to five sensors to the device, almost all drive-related information can be managed directly; a local pre-processing of the signals relieves the field bus whilst ensuring a rapid and reproducible response time
- Integrated EMC filter Class A (according to EN 55011)
- Integrated brake actuation, supported braking voltages 400 V AC / 180 V DC and 230 V AC / 205 V DC
- Integrated motor protection thanks to thermal motor model and evaluation of PTC, Thermo-Click or KTY 84 temperature sensors
- Simple device replacement and time-saving copying of parameters to the memory card by the optional memory card holder and the optional MMC memory card
- Engineering and commissioning with uniform engineering tools such as SIZER (from V3.2), STARTER (from V4.1.3) and Drive ES ensure rapid configuration and simple commissioning – with Drive ES Basic STARTER is integrated into STEP 7 providing the benefits of central data storage and consistent communication
- Software parameters for simple adaptation to 50 Hz or 60 Hz motors (IEC or NEMA motors)
- Increased robustness and longer service life due to painting of the electronics assemblies
- Certified worldwide according to CE, UL, c-tick

6

Application

SINAMICS G110D is perfectly suited for simple conveyor applications in an industrial environment in which a distributed drive with communication capability is required. This is particularly true for distribution logistics and for airports.

SINAMICS G110D is also suitable for many other lower-performance applications in many fields, e.g. in the automotive industry, in the food and drinks industry (without tensides) and in the packaging industry.

AS-Interface slaves
3SF5 pushbuttons and indicator lights
AS-Interface enclosures and front panel modules
General data

■ **Overview**

Distributed command devices of the 3SB3 series can be quickly connected to the AS-Interface using AS-Interface enclosures. Using suitable components you can make your own enclosures with integrated AS-Interface or flexibly modify existing enclosures.

Installation of AS-Interface slaves

The following
slave types are available for connecting the command points:
- Slave in A/B technology with 4 inputs and 3 outputs
- Slave with 4 inputs and 4 outputs
- F Slave with two secure inputs for EMERGENCY-STOP mushroom pushbutton

The following table shows the maximum number of equippable slaves:

Enclosures for	Number of slaves for enclosures without EMERGENCY-STOP	Number of slaves for enclosures with EMERGENCY-STOP
1 command point	Not available	1 x F slave
2 command points	1 x slave 4I/4O or 4I/3O	Not available
3 command points	1 x slave 4I/4O or 4I/3O	1 x slave 4I/4O or 4I/3O + 1 x F slave
4 command points	2 x slave 4I/4O or 4I/3O [1]	2 × slave 4I/4O or 4I/3O + 1 × F slave [1]
6 command points	2 x slave 4I/4O or 4I/3O	2 x slave 4I/4O or 4I/3O + 1 x F slave

[1] For metal enclosures with 4 command points, only 1 x slave 4I/4O or 4I/3O is possible.

Connection

For connecting a slave to contact blocks and lampholders and the connection element, one set of links is needed for each.

The connection elements are mounted in the front-end cable glands and are used for connection of the AS-Interface or for bringing unused inputs or outputs out of the enclosure.

For connection to AS-Interface can be selected between:
- Terminal for shaped AS-Interface cable.
  The cable is contacted by the insulation piercing method and routed past the enclosure on the outside (possible only with plastic enclosure).
- Cable gland for the shaped AS-Interface cable or round cable. The cable is routed into the enclosure (preferable for metal enclosure).
- Connection using M12 plug.

If less than all inputs/outputs of the installed slaves in an enclosure are used for connecting the command devices, free inputs and outputs can be routed on request to the outside through an M12 socket on the top or bottom side of the enclosure.

To supply inputs with power, the S+ connection of the must be assigned to the socket, for outputs the OUT– connection must be assigned.

Addressing is performed using the AS-Interface connections or the integrated addressing socket. An external power supply is not required.

Note:

Dimensional drawings, manuals and further technical information can be found on the Internet at:
www.siemens.com/industrial-controls/support

Enclosures

Color of enclosure cover:
- Gray, RAL 7035, or
- Yellow, RAL 1004, for EMERGENCY-STOP.

Color of enclosure base:
- Black, RAL 9005

AS-Interface slaves
3SF5 pushbuttons and indicator lights

**AS-Interface enclosures and front panel modules
With standard fittings**

■ Overview

Enclosures with standard fittings are available with:
- 1 to 3 command points
- Operational voltage through AS-Interface (approx. 30 V)
- Vertical mounting type
- Plastic enclosures are equipped with plastic actuators and indicators, metal enclosures are equipped with metal actuators and indicators.

The enclosures without EMERGENCY-STOP each have one user module with 4I/3O; the enclosures with EMERGENCY STOP mushroom pushbuttons have a safe AS-Interface slave integrated in the enclosure.

Enclosures with EMERGENCY-STOP mushroom pushbuttons are fitted with two NC contact blocks, which are wired to the safe slave. The contact blocks and lampholders (with spring-type terminals) of the control device, and the AS-Interface slaves, are mounted in the base of the enclosure and are cable-connected.

The plastic enclosures are designed with a connection for the AS-Interface flat cable (the cable is run passed the outside of the enclosure). For metal enclosures, the AS-Interface cable is run inside the enclosure.

The enclosures with EMERGENCY-STOP mushroom pushbuttons have a yellow top part. They are also available with an M12 plug.

AS-Interface slaves
3SF5 pushbuttons and indicator lights

**AS-Interface enclosures and front panel modules
Customized equipment**

■ Overview

The enclosures can be equipped with command devices as required for customized solutions to connect command devices to the AS-Interface.

Customized enclosures are available with 2 to 6 command positions.

One command point comprises:

- 1 actuator or indicator
- Up to 3 contact blocks or up to 2 contact blocks + 1 lampholder
- 1 inscription label

For plastic enclosures the command points are equipped as standard with plastic actuators and indicators, for metal enclosures they are equipped with metal actuators and indicators.

Installation of AS-Interface slaves

The following slave types are available for connecting the command points:

- Slave in A/B technology with 4 inputs and 3 outputs
- Slave with 4 inputs and 4 outputs
- F slave with 2 safe inputs for EMERGENCY-STOP

The following table shows the maximum number of equippable slaves:

Enclosures for	Number of slaves for enclosures without EMERGENCY-STOP	Number of slaves for enclosures with EMERGENCY-STOP
2 command points	1 x slave 4I/4O or 4I/3O	Version not available
3 command points	1 x slave 4I/4O or 4I/3O	1 x slave 4I/4O or 4I/3O + 1 x F slave
4 command points	2 x slave 4I/4O or 4I/3O [1]	2 × slave 4I/4O or 4I/3O + 1 × F slave [1]
6 command points	2 x slave 4I/4O or 4I/3O	2 x slave 4I/4O or 4I/3O + 1 x F slave

[1] For metal enclosures with 4 command points, only 1 x slave 4I/4O or 4I/3O is possible.

Connection

The customized enclosure is delivered fully equipped and wired. For connection to AS-Interface can be selected between:

- Terminal for shaped AS-Interface cable.
  The cable is contacted by the insulation piercing method and routed past the enclosure on the outside (possible only with plastic enclosure).
- Cable gland for the shaped AS-Interface cable or round cable. The cable is routed into the enclosure (preferable for metal enclosure).
- Connection using M12 plug.

If less than all inputs/outputs of the installed slaves in an enclosure are used for connecting the command devices, free inputs and outputs can be routed on request to the outside through an M12 socket on the top or bottom side of the enclosure. The desired pin arrangement of the M12 socket must be stated in the order documents

To supply inputs with power, the S+ connection of the must be assigned to the socket, for outputs the OUT– connection must be assigned.

Addressing is performed using the AS-Interface connections or the integrated addressing socket. An external power supply is not required.

EMERGENCY STOP

For enclosures with EMERGENCY STOP, the EMERGENCY-STOP mushroom pushbutton can be wired conventionally or via a secure AS-Interface slave, as desired.

For conventional wiring of the EMERGENCY-STOP mushroom pushbutton, up to three switching contacts can be selected for the EMERGENCY STOP. If the EMERGENCY STOP is prompted via AS-Interface, two contacts are possible for the safety circuit.

With conventional wiring, the scanning of one EMERGENCY-STOP contact block through AS-Interface is possible.

■ Selection and ordering data

The selection and ordering of the customized enclosure is made directly via the 3SB3/3SF5 configurator for pushbuttons and indicator lights.

An electronic order form will be generated for the additional options. The configurator is available in the electronic catalog CA 01 on CD-ROM or DVD or in the online catalog (Mall) on the Internet:
www.siemens.com/industrymall

Select the configurator for "Pushbuttons and indicator lights 3SB3, 3SF5" from the list of configurators.
Start the configuration with the list entry "Version" and select the "Customized enclosure ASI".

The list price of the complete enclosure is generated in the configurator for the customized equipment. Registration and login in the configurator is required for this.

Please send the resulting electronic order form along with your order to our Competence Center at
sirius-attach.aud@siemens.com

If you are unable to access either catalog, please contact our Technical Assistance.

Overview

With the AS-Interface front panel module, 3SB3 control devices, which are mounted on to the front panels, can be connected to the AS-Interface bus system. Plastic or metal pushbuttons or indicator lights in round or square design can be used. Mushroom pushbuttons and acoustic signaling devices cannot be used.

The front panel module comprises:

• Slave 4I/4O
• 4 3SB3 commanding and signaling devices
• Accessories (lamps, name plates, mounting parts)

The selection of standard fittings is made through the ordering documents (see next page).

The front panel module is mounted on the back of the front panel on a group of four actuators and indicators arranged alongside or on top of each other and secured with screws. The contact blocks and lampholders are integrated in the module.

A 30 mm x 45 mm grid must be considered when mounting the control devices on to the front plate.

Connection to the AS-Interface shaped cable is by means of a terminal positioned on the rear of the module using the insulation piercing method.

Addressing is performed using the AS-Interface connections or the integrated addressing socket.

Selection and ordering data

Version	Order No.
AS-Interface front panel module for 3SB3 control devices	
4I/4O	**3SF5 874-4AZ**

AS-Interface slaves
3SF5 pushbuttons and indicator lights
AS-Interface enclosures and front panel modules
Front panel module

■ **Selection and ordering data**

To order the front panel module, please fill out the order form and include it with your order. These order documents cannot be generated via the 3SB3/3SF5 configurator. The electronic order form is available from our Technical Support:

Tel. +49 (0)911 895-59 00
Fax +49 (0)911 895-59 07

Enter the desired options in the order form, e.g. type of actuators and indicators, switching contacts, lampholders or accessories (labels or the like). The codes that are to be entered in the form

can be obtained from the list of options that are subject to a surcharge.

The price of the device is made up of the basic price of the module and the additional prices for the fittings.

The additional prices include all components which depend on the selected configuration options (actuators and indicators, switching contacts, lampholders and accessories).

AS-Interface slaves
8WD4 signaling columns

General data

■ **Overview**

The 8WD4 signaling columns are flexible in design and versatile in use.

These are used for controlling complex processes in machines or automated processes or as visual or acoustic warning systems in emergency situations, e.g. for displaying individual stages of production.

8WD44 signaling columns with connection to AS-Interface cables

Two product series are available:
- 8WD42
  - Thermoplast enclosure, diameter 50 mm
  - Degree of protection IP54
- 8WD44
  - Thermoplast enclosure, diameter 70 mm
  - Advanced design and significantly improved illumination
  - Fast and flexible when connected through spring-type terminals (optional)
  - Integrated degree of protection IP65

Communication through AS-Interface

The 8WD4 signaling columns can be directly connected to the AS-Interface bus system through an adapter element that can be integrated in the column. Wiring outlay is reduced as the result.

Connection

8WD42:

The two-wire bus cable is fixed to the screw terminals in the connection element. The adapter element must be the first module to be mounted on the connection element. A maximum of 4 signaling elements can then be mounted on it.

The adapter element 8WD42 28-0BB is a standard slave.

8WD44:

The two-wire bus cable is fixed to the screw or spring-type terminals in the connection element. The adapter element must be the first module to be mounted on the connection element. The signaling elements can then be mounted on it.

The adapter element 8WD44 28-0BE is a standard slave. A maximum of 4 signaling elements can be mounted on it.

The adapter element 8WD44 28-0BD with A/B technology enables the connection of up to 62 slaves on one AS-Interface system. The addressing socket provides user-friendly parameterization of the AS-Interface elements. A maximum of 3 signaling elements can be mounted on it.

Overview

AS-Interface power supply unit for 3A

AS-Interface power supply units feed 30 V DC into the AS-Interface cable and supply the AS-Interface components. They include power-optimized data decoupling for the separation of communication signals and control supply voltage. As the result, AS-Interface is able to convey both data and power along a single line. The power supply units are resistant to overloads and short circuits.

Dimensions

AS-Interface power supply units have compact dimensions in widths of 50 / 70 / 120 mm. No distances from other devices need to be observed when mounting the power supply units.

Features

- Higher rating: The power supply units deliver currents of 2.6 to 8 A.
- Integrated data decoupling: As the result, AS-Interface is able to convey both data and power along a single line.
- Integrated ground-fault detection: The power supply units perform the reliable detection and signaling of ground faults according to IEC 60204-1. The AS-Interface voltage can be disconnected automatically in the event of a ground fault.
- Integrated overload detection: An output overload is detected and reported over a diagnostics LED.
- Diagnostics memory: Any ground faults or overloads on the output side are stored in a diagnostics memory until the device is reset.
- Remote reset and remote signaling: Using relay contacts, a ground fault can be signaled and evaluated by a central controller and/or indicator light.
- Diagnostics LEDs: Three different LEDs indicate the status of the AS-Interface power supply locally at the power supply unit.
- Ultra-wide input range / two-phase connection: The ultra-wide input range of 120 to 500 V of the 8 A version means that the supply units can be used in virtually any network worldwide. In addition, this version dispenses with the need for an N conductor as the device can be connected directly between 2 phases of a network.
- Operation with 24 V DC: The 3 A power supply unit is also available as a version with a 24 V DC input. This power supply unit is suitable for use in battery-powered systems or in systems with UPS (uninterruptible power supply).
- Removable terminal blocks with spring-type connections: For easy exchanging of devices, each power supply unit has three removable terminal blocks: for the input side, for the output side and for Signal/Reset connections.

Benefits

- Complete solution for supplying AS-Interface networks while making full use of the maximum possible cable length of 100 m or 200 m (with an extension plug) per AS-i Segment
- Only AS-i masters and AS-i slaves need to be connected to the AS-Interface cable in order to operate AS-Interface
- Compact, space-saving dimensions
- Reliable power supply even for large numbers of AS-Interface modules with a high power requirement
- Integrated ground-fault and overload detection saves the need for additional components and enhances safety

- Fast fault detection and reduced downtimes thanks to diagnostics memory, remote signaling and remote reset
- Reduced downtimes as the result of removable terminal blocks which enable the fast exchanging of devices
- Ultra-wide input range of the 8 A version permits single-phase and two-phase operation and saves the need for an N conductor
- Can be used world-wide thanks to for example UL/CSA approval (UL 508)
- With the 2.6 A version the output power is restricted to max. 100 W for use in NEC Class 2 circuits.

AS-Interface
Power supply units and data decoupling modules

S22.5 data decoupling modules

■ Overview

AS-Interface S22.5 double data decoupling modules
Left: screw terminal version, Right: spring-type terminal version

With the aid of the S22.5 data decoupling module, the AS-Interface network can also be supplied with 24 V DC or 30 V DC from a standard power supply unit and the transmission of data and power can be realized along one cable.
The combination of data decoupling modules and standard power supply units is therefore a cost-efficient alternative to the service-proven AS-Interface power supply units.
The quality of the data signals and the reliable operation of the AS-i network are not negatively affected as the result.

Features of the S22.5 data decoupling module

- Degree of protection IP20
- Narrow design: 22.5 mm wide
- Version with screw or spring-type terminals
- Versions for single and double data decoupling
- Connection of several AS-Interface networks to one power supply unit is possible
- Operation with 24 V DC or 30 V DC, grounded or non-grounded
- Adjustable current limiting up to 2 x 4 A
- Integrated ground-fault detection with fault storage
- Diagnostics LEDs and signaling contacts
- Reset by button or remote reset

Ground-fault detection

The integrated ground-fault detection works with a grounded and non-grounded supply: The connection of negative pole and ground (upstream from the data decoupling module) customary with 24 V DC power supplies is permitted. A ground fault to the negative or positive pole on the AS-Interface network (downstream from the data decoupling module) is detected and stored as a fault and will be signaled using LEDs and a relay contact.

■ Benefits

- Compatible expansion of the AS-Interface system
- An existing standard power supply unit with 24 V DC or 30 V DC can be used for supplying AS-i networks
- The AS-Interface system can also be used in tightly budgeted applications because no AS-Interface power supply unit needs to be purchased
- Applications benefit in addition from the advantages of a modern bus system:
  - High level of standardization
  - Additional diagnostics and maintenance information
  - Faster commissioning
- Easy and cost-efficient construction of single and multiple networks is possible

■ Application

The AS-Interface data decoupling module is designed for AS-Interface networks with 30 V supply or 24 V supply (AS-Interface Power24V).

Operation of an AS-i network with the data decoupling module and a 30 V DC standard power supply unit is technically equivalent to the use of an AS-Interface power supply unit and offers the service-proven features of AS-Interface for all applications.

AS-Interface Power24V uses a 24 V DC power supply unit in conjunction with a data decoupling module and is particularly suitable for

- Compact machines using AS-Interface input/output modules
- Applications in the control cabinet for AS-Interface integration of SIRIUS Innovation contactors and compact feeders (3RT2 contactors through 3RA27 function modules or 3RA6 compact feeders through AS-i 3RA69 add-on modules)

When using the double data decoupling module or additional data decoupling modules, several AS-Interface networks can be operated with a single power supply unit. This results in an additional cost advantage.

Note:

The length of an AS-i Power24V network is restricted to 50 m in order to limit the voltage drop along the cable.

AS-i masters, AS-i slaves and the sensors and actuators supplied through the AS-i cable must be designed for the reduced voltage. Sensors and actuators for the standard voltage range of 10...30 V can be supplied with sufficient voltage.

The power supply units must comply with the PELV Standard (Protective Extra Low Voltage) and have a residual ripple of < 250 mVpp. We recommend power supply units from the SITOP range, see Catalog IC 10.

6

Application (continued)

Construction of an AS-i Power24V network with an AS-Interface S22.5 data decoupling module

Construction of an AS-i Power24V network with an AS-Interface S22.5 data decoupling module: Left: single network, Right: multiple network

AS-Interface shaped cables

■ Overview

AS-Interface shaped cables

The actuator-sensor interface – the networking system used for the lowest field area – is characterized by very easy mounting and installation. A new connection method was developed specially for AS-Interface.

The stations are connected using the AS-Interface cable. This two-wire AS-Interface shaped cable has a trapezoidal shape, thus ruling out polarity reversal.

Connection is effected by the insulation piercing method. In other words, male contacts pierce the shaped AS-Interface cable and make reliable contact with the two wires. Cutting to length and stripping are superfluous. Consequently, AS-Interface stations (e. g. I/O modules, intelligent devices) can be connected in the shortest possible time and exchanging devices is quick.

To enable use in the most varied ambient conditions (e. g. in an oily environment), the AS-Interface cable is available in different materials (rubber, TPE, PUR).

For special applications it is also possible to use an unshielded standard round cable H05VV-F 2x1.5 mm² according to AS-i Specification. With AS-Interface, data and energy for the sensors (e.g. proximity switches BERO) and actuators (e. g. indicator lights) are transmitted over the yellow AS-Interface cable.

The black cable must be used for actuators with a 24 V DC supply (e. g. solenoid valves) and a high power requirement.

Suitable for operation in tow chains

The use of the AS-Interface shaped cables with TPE and PUR outer sheath was checked in a tow chain test with the following conditions:

Chain length	m	6
Travel	m	10
Bending radius	mm	75
Travel speed	m/s	4
Acceleration	m/s²	4
Number of cycles		10 million
Duration of test		approx. 3 years (11000 cycles per day)

After termination of the 10 million cycles only slight wear was visible due to the lugs of the tow chain. No damage to the cores and core insulation could be detected.

Note:

When using a tow chain, the cables must be installed such that they are not subject to tensile forces. On no account may the cables be twisted, but must be routed flat through the tow chain.

Overview

AS-Interface repeater

AS-Interface repeaters are used for extending the AS-Interface cable by 100 m per repeater and have the following features:

- Maximum two repeaters in series
- Parallel switching of several repeaters possible (star configuration option)
- Maximum size increase of an AS-Interface network to up to 500 m is thus possible
- Easy mounting
- IP67 module enclosure

Design of an AS-Interface network with repeaters

- Slaves can be used on both sides of the repeater
- AS-Interface power supply is required on both sides
- Electrical separation of the two AS-Interface shaped cable lines
- Installed in K45 module enclosure with mounting plate
- Separate indication of the correct AS-Interface voltage for each side
- Maximum two repeaters in series (max. cable length 300 m)
- Parallel switching of several repeaters possible (star configuration)
- Combination of series and parallel switching possible (max. range 500 m)

Design of an AS-Interface network with repeaters (example)

Benefits

g e**get** Designed for Industry

- More possibilities of use and greater freedom for plant planning through extension of the AS-Interface network
- Reduced downtime and servicing times in the event of a fault thanks to separate indication of the correct AS-Interface voltage for each side

Application

The repeater is used to lengthen the AS-Interface segment by 100 m. In this case there are AS-Interface slaves and one AS-Interface power supply on each side of the repeater.

Note:

The AS-Interface repeater is not suitable for AS-i Power24V networks. It is recommended for use in AS-Interface networks with AS-Interface power supply units (e.g. 3RX9 501-0BA00).

System components and accessories

Extension plug

Overview

AS-Interface extension plug (on AS-Interface M12 feeder)

With the extension plug/extension plug plus it is possible to double the cable length possible in an AS-Interface segment from 100 to 200 m.

The extension plug is a passive component, the extension plug plus is equipped in addition with an A/B slave.

The extension plug / extension plug plus has an M12 plug and can be connected with it to the AS-Interface M12 feeder with degree of protection IP67. Only one power supply unit is needed to supply power to the slaves on the up to 200 m long segment.

Design of an AS-Interface segment with an extension plug

To construct an AS-Interface segment with a cable length of more than 100 m and up to a maximum of 200 m, the extension plug or extension plug plus is installed at that point of the network which in a range of approx. ±10 m is furthest from the AS-Interface power supply unit. The extension plug is not allowed to be used in AS-Interface networks smaller than 100 m. As with all AS-Interface networks, any network structure (line, tree, star) is possible when using the extension plug/extension plug plus. Only one extension plug/extension plug plus is required per 200 m segment even with a tree or star structure.

Note:

The AS-Interface extension plug and the extension plug plus are not suitable for AS-i Power24V networks. Both are recommended for use in AS-Interface networks with AS-Interface power supply units (e.g. 3RX9 501-0BA00).

Maximum network size with repeaters and extension plug (master at center of network)

[1] For connection to the AS-Interface flat cable you need the AS-Interface M12 feeder, which must be ordered separately, see section "Accessories".

Overview

New addressing unit V 3.0 for AS-Interface

The addressing unit is used to each AS-Interface slave to assign an address to during commissioning. The device detects a connected slave module or a complete AS-i network and displays the found module in the LCD display. Via the on/down keys can each address can be individually set. By turning the rotary switch to the setting are intuitive further commissioning functions selected. The innovative device has been to the current AS-i Specification V3.0 and can now also adapted the I/O data of the latest Slaves operator control.

Function

- Reading out and adjusting the slave address 0 to 31 or 1A to 31A, 1B to 31B, with automatic addressing aid and prevention of double addresses
- Reading out the slave profile (IO, ID, ID2)
- Reading out and adjusting the ID1 code
- Input/output test when commissioning the slaves: Input signals read and outputs write with all digital and analog slaves according to AS-Interface Specification V 3.0, including safe input slaves and complex CTT2 slaves
- Measuring the voltage on the AS-Interface cable (measuring range from 2 to 35 V)
- Indication of the operational current in case of direct connection of an AS-i slave (measuring range from 0 to 150 mA)
- Storage of complete network configurations (profiles of all slaves) to simplify the addressing
- Adjusting the Slave parameters for commissioning
- Reading out the identification and diagnostics of CTT2 slaves
- Reading out the code table of safe input slaves (ASIsafe)

Note:

The following applies to the operation of the addressing units to an AS-Interface cable assembly with connected power pack: The AS-Interface addressing unit is suitable for standard AS-i networks and AS-i Power24V networks (operational voltage on the AS-Interface cable min. 19 V).

Benefits

- Increased supply power to the slaves to 150 mA
- Better utilization of the battery capacity thanks to improved circuitry
- Support for the current AS-i Specification V3.0
- Expanded display for simultaneous displaying input and output states
- Clearly recognizable display of status digital inputs/outputs in binary format (0 / 1), optionally also available as hexadecimal values
- Intuitive display analog data either decimal, hexadecimal or as a percentage (e. g. 100 % Corresponds to input/output value 20 mA)
- I/O data of complex slaves (CTT2 profile) can be displayed
- Decoded display of the input data of safe input slaves, including code table
- Simplification of the operating steps when setting the slave address with automatic read back the set address
- Addressing cable, with even without screwing in tight into the M12 socket ready for operation, this faster availability of the addressing unit
- Proven compact housing with smooth keys and rotary switch
- Connection of standard AS-i networks with 30 V as well as networks is possible Power24V
- Complex slaves with high operating current can be addressed without external supply
- Longer operating time per battery pack
- Can be used with all types of digital and analog slaves
- Comprehensive and fast Input/Output test of plants, even if A/B modules with 4 DI / 4 DO and current analog modules with an A/B address
- Faster and more reliable commissioning of the AS-Interface modules
- One-hand operation possible, with unique selection of the functions
- Universal applicability for all AS-i networks

 3RK1 902-4BA00-5AA0	**M12 plug straight** [3] • For screw fixing, 5-pole screw terminal, max. 0.75 mm^2, • A-coded, max. 4 A	**3RK1 902-4BA00-5AA0**

[1] Can be ordered only from the following address:
GMC-I Messtechnik GmbH
 Südwestpark 15, D-90449 Nuremberg
Tel. +49 911 8602 - 0, Fax: +49 911 8602 - 669
Email: info@gossenmetrawatt.com
Internet: www.gossenmetrawatt.com

[2] Not included in scope of supply of the 3RK1 904-2AB02 addressing unit

[3] For connecting the addressing unit to an AS-i network via AS-Interface
M12 feeder a connecting cable (M12 plug to M12 connector) is produced
and requires the following wiring:
- M12 cable plug Pin 1 / core brown <-> M12 plug: Pin 1
- M12 cable plug: Pin 3 / core blue <-> M12 plug: Pin 3
- Pin 2, 4, 5 not connected

■ Overview

AS-Interface analyzer

The AS-Interface analyzer is used to test AS-Interface networks. It enables systematic troubleshooting and permanent monitoring.

Installation errors, e. g. loose contacts or EMC interference under extreme loads, can be revealed by this device.

Thanks to the easy-to-use software the user can assess the quality of complete networks even if he lacks detailed specialist knowledge of AS-Interface. In addition it is an easy matter with the AS-Interface analyzer to create test logs from the records produced, thus providing documentation for start-ups and service assignments.

For advanced AS-Interface users there are trigger functions for detailed diagnostics.

Connection

The AS-Interface analyzer follows the communication on the AS-Interface network as a passive station. The unit is supplied simultaneously from the AS-Interface cable.

This analyzer interprets the physical signals on the AS-Interface network and records the communication.

The data thus obtained are transferred through an RS 232 interface to a PC such as a notebook, for evaluation with the supplied diagnostics software.

■ Benefits

- Simple and user-friendly operation enables diagnostics of AS-Interface networks without help from specialists
- Speedy troubleshooting thanks to intuitive display in statistics mode
- Test logs provide verification of the state and quality of the installation for service and approval
- Recorded logs facilitate remote diagnostics by technical assistance
- Comprehensive trigger functions enable exact analysis
- Process data can be monitored online

■ Application

Online statistics

This mode provides a quick overview of the existing AS-Interface system. The error rates are presented per slave in a traffic-light function (green, yellow, red).

The bus configuration and the currently transmitted data of the slaves are shown in a well arranged presentation.

With the expanded statistics function it is possible to determine the error rates as the number of transmitted or faulty bus message frames.

The bundle error overview shows in steps how many multiple repetitions of message frames occurred in order to enable a selective and look-ahead assessment of the transmission quality.

6

AS-Interface
System components and accessories

▪ Application (continued)

Data mode

In this mode the analyzer now shows not only the
digital input/output values but also the current analog values and
the input status of the safety slaves.

Trace mode

The presentation of message frames in the style of a classic field
bus analyzer is indispensable for complex troubleshooting. Extensive trigger functions and recording and viewing filters are
available for this purpose.

An external trigger input and trigger output round off the scope
of functions in order to find even the most difficult errors.

For troubleshooting in connection with safety monitor applications, changes of status in the code tables of safety slaves are
identified and assessed.

Test log

The recorded data of the online statistics are easy to output and
document using a test log. Verification of the state of the plant
can thus be provided for approvals or service assignments.

The new measurement assistant records the bus signals for an
adjustable period, automating the creation of the test log. A standardized quality test of AS-i plants is thus possible.

Note:

The AS-Interface Analyzer is suitable for standard AS-i networks
and AS-i Power24V networks (operating voltage min. 20 V).

6

Overview

AS-Interface function block library for SIMATIC PCS 7: User interface

The AS-Interface function block library for PCS 7 is integrated in the SIMATIC PCS 7 process control system and expands it for integration of the AS-Interface system.

As the result, the advantages of AS-Interface such as the considerable reduction of wiring outlay for distributed actuators/sensors and very simple installation can also be used in a system based on PCS 7.

The library contains modules for accessing the I/O data of AS-i slaves, modules for diagnostics of the AS-i system, and a faceplate for the PCS 7 Maintenance Station.

The AS-i CP 343-2 / CP 343-2P masters are supported within an ET 200M station connected through PROFIBUS.

For direct connection to PROFIBUS it is possible to use DP/AS-i Link Advanced as an AS-i single master and double master.

Digital AS-i standard slaves and A/B slaves (according to AS-Interface Specification V 3.0) can be used on the CP 343-2 and CP 343-2P.

In combination with DP/AS-i LINK Advanced it is also possible to integrate analog AS-i slaves.

Hardware and software requirements

The library requires PCS 7 Version V 6.1, V 7.0 or V 7.1

Types of delivery and license

The function block library supplied on CD-ROM allows the user to run the required engineering software on the engineering station (single license) including the runtime software for executing the AS modules in an automation system (single license).

If the AS modules are to be used in additional automation systems, the corresponding number of runtime licenses are required which are supplied without a data carrier.

Selection and ordering data

Version	Order No.
AS-Interface function block library for PCS 7	
Scope of supply AS modules and faceplates for integrating AS-Interface into the PCS 7 process control system, for PCS 7 version V 6.1 V 7.0 or V 7.1

IO-Link

IO-Link
Introduction

Transmission technology

Overview

IO-Link is a new communication standard for sensors and actuators - defined by the Profibus User Organization (PNO). IO-Link technology is based on the point-to-point connection of sensors and actuators to the control system.

Extensive parameter and diagnostics data are transmitted in addition to the cyclic operating data for the connected sensor/actuators. The simple, unshielded three-wire cable customary for standard sensors is used for this purpose.

Compatibility of IO-Link

IO-Link guarantees compatibility between IO-Link-capable modules and standard modules as follows:

- IO-Link sensors can be operated both on IO-Link modules (master) and standard input modules.
- IO-Link sensors/actuators as well as today's standard sensors/actuators can be used on IO-Link masters.
- If conventional components are used in the IO-Link system, then of course only the standard functions are available at this point.

Enhanced through IO-Link input modules

IO-Link compatibility also permits connection of standard sensors/actuators, i. e. conventional sensors/actuators can also be connected to IO-Link. This is particularly effective with the IO-Link input modules, which allow several sensors to be connected at one time via a cable to the controller.

Analog signals

Another advantage of IO-Link technology is that analog signals are digitized already in the IO-Link sensor itself and are digitally transmitted by the IO-Link communication. As the result, faults are prevented and there is no extra cost for cable shielding.

Load Feeders and Motor Starters

Through IO-Link it is possible control not only sensors but also actuators in the form of load feeders and motor starters.

Possibilities for connecting load feeders and motor starters to IO-Link or in the conventional way

7

Overview

IO-Link product family

Benefits

The IO-Link system offers decisive advantages for connecting complex (intelligent) sensors/actuators:

- Dynamic changing of sensor/actuator parameters directly by the PLC
- Consistent storage of parameters enables devices to be exchanged during operation, without a PC or programming device, through re-parameterization from the PLC
- Fast commissioning thanks to central data storage
- Consistent diagnostics information as far as the sensor/actuator level
- Uniform and greatly reduced wiring of different sensors/actuators/controls
- Integrated communication: Transmission of process data and service data between sensors/actuators and the control system
- Uniform and transparent configuring and programming through use of a parameterization tool integrated in SIMATIC STEP 7 (Port Configurator Tool, PCT)
- Transparent representation of all parameter and diagnostics data

Application

IO-Link can be used in the following main applications:

- Easy connection of complex IO-Link sensors/actuators with a large number of parameters and diagnostic data to the control system
- Replacement of sensor boxes for connecting binary sensors with the IO-Link input modules optimized in terms of cabling
- Wiring-optimized connection of controls to the control system

In these cases, all the diagnostics data are transmitted to the higher-level control system through IO-Link. The parameter settings can be changed during operation. Central data storage means that it is possible to exchange an IO-Link sensor/actuator without a PC or programming device.

Integration in STEP 7

Integration of the device configuration in the STEP 7 environment guarantees:

- Easy and quick engineering
- Consistent data storage
- Speedy locating and rectifying of faults

IO-Link master module for ET 200S
IO-Link 4SI electronic module

Overview

IO-Link 4SI electronic module for ET 200S

The 4SI IO-Link electronic module is an IO-Link master and enables easy integration of sensors and actuators from different manufacturers in the SIMATIC ET 200S multifunctional, distributed I/O system at a total of four ports.

Features

- Up to 4 IO-Link devices (3-wire connections) can be connected to each IO-Link master module.
- Up to 4 standard sensors (2-wire/3-wire connection) can be connected.
- The 4SI IO-Link electronic module has a width of 15 mm and can be used with the following universal terminal modules:
  - TM-E15S26-A1 (screw terminals)
  - TM-E15C26-A1 (spring-type terminals)
  - TM-E15N26-A1 (Fast Connect)
- Supports firmware update (STEP 7 V5.4 SP4 and higher).

■ **Overview**

4SI SIRIUS electronic module for ET 200S

The 4SI SIRIUS electronic module allows the simple and cost-effective connection of SIRIUS devices with the IO-Link to the multi-functional, decentralize peripheral system SIMATIC ET 200S at a total of four ports.

Features

• Up to 4 SIRIUS devices can be connected on to the 4 ports of the 4SI SIRIUS.
 3RA6 compact feeders or load feeders with 3RA27 function modules can even be bundled in groups of 4 devices on one IO-Link port.
 It is possible therefore to connect up to 16 load feeders to the control system at one IO-Link master module.

• The 4SI SIRIUS electronic module has a width of 15 mm and can be used with the following universal terminal modules:
 - TM-E15S26-A1 (screw terminals)
 - TM-E15C26-A1 (spring-type terminals)
 - TM-E15N26-A1 (Fast Connect)

• Supports firmware update (STEP 7 V5.4 SP5 and higher)

IO-Link master module for ET 200eco PN

■ Overview

IO-Link master module for ET 200eco PN

The IO-Link master module ET 200eco PN belongs to the compact block I/O family ET 200eco PN.

Features
- Compact block I/Os for processing digital and IO-Link signals for connecting to the PROFINET bus system
- Construction without control cabinet, degree of protection IP67 with M12 connection method
- Very robust and resistant metal casing and enclosure
- Compact module in 60 mm x 175 mm x 37 mm casing (W x H x D, short and thick enclosure) with 8 x M12 for digital signals and IO-Link
- PROFINET connection: 2 x M12 and automatic PROFINET addressing
- Data transmission rate 100 MBit/s
- LLDP proximity detection without PG
- Supply and load voltage connection: 2 x M12
- Channel-specific diagnosis

7

Overview

IO-Link input modules

Using IO-Link technology it is basically possible to connect standard sensors to IO-Link masters.
Such a direct connection of standard sensors to the IO-Link master does not, however, maximize the potential of IO-Link. The IO-Link Module technology provides the solution. Its use is a more economically attractive solution in comparison with the direct connection of a sensor.

IO-Link input modules are a sensible addition to the decentralize periphery ET 200S. The IO-Link input module technology enhances IO-Link via a pure point-to-point cable connection towards decentralized structures. The length of the cables for an IO-Link connection between an IO-Link module and IO-Link master can be a maximum of 20m. The use of sensor boxes with accordingly complex and error-prone wiring is no longer necessary.

Transmission of parameter and diagnostic signals

The IO-Link input modules also offer the possibility of conveying parameters and diagnosis messages. This enables for example the inputs of modules to be parameterized as NC contacts or NO contacts through IO-Link. An overload or short circuit in the sensor supply is signaled to the control system through the IO-Link master.

M8 and M12 terminals

M8 and M12 terminals are available for connecting the sensors. Connection to the IO-Link master is made using a standard M12 connecting cable.

Benefits

The use of IO-Link input modules has the following benefits:
• Economical use of innovative IO-Link technology also for binary sensors
• Optimum use of all ports of the IO-Link master
• Connection of several binary sensors/actuators to one port of the IO-Link master, hence low-cost connection of also binary sensors/actuators to the control system through IO-Link
• Reduction of digital input modules in the peripheral station
• Use of parameters also for binary sensors (e. g. NC contacts, NO contacts and input delay can be parameterized)
• Reduction of cabling and hence less risk of wiring errors by dispensing with sensor boxes
• Expansion toward distributed structures using pure point-to-point wiring
• Easy and elegant integration of sensors within a radius of 20 m around an ET 200S station
• Possibility of transmitting parameter and diagnostic signals (e. g. sensor supply overload)
• Can also be used in harsh conditions thanks to the very compact design and degree of protection IP67

Application

IO-Link input modules are particularly used where sensor boxes had previously been used for the connection of binary sensors.

"Automation technology" --> "Industrial communication"
--> "IO-Link" --> "Input modules" --> "IO-Link module K20".

■ Overview

Contactors with communication interface, sizes S00 and S0

Contactor versions with a communication interface are required for the connection to the controller via IO-Link or AS-Interface. The connection is made via function modules, which are mounted on to the front side of the contactors.

Contactors with communication interface in size S00 with spring-type terminals and size S0 with screw terminals

Standards

IEC 60947-1, EN 60947-1,
IEC 60947-4-1, EN 60947-4-1,
IEC 60947-5-1, EN 60947-5-1 (auxiliary switches)

The 3RT20 contactors for switching motors are climate-proof and are tested and suitable for use worldwide.

If the devices are used in ambient conditions which deviate from common industrial conditions (IEC 60721-3-3 "Stationary Use, Weather-Protected"), information must be obtained about possible restrictions with regard to the reliability and endurance of the device and possible protective measures. In this case contact our Technical Assistance.

The 3RT2 contactors are finger-safe according to EN 50274.

The contactors are suitable for screw fixing or for mounting on TH 35 standard mounting rails according to IEC 60715.

Contact reliability

If voltages ≤ 110 V and currents ≤ 100 mA are to be switched, the auxiliary contacts of the 3RT2 contactor or 3RH21 contactor relay should be used as they guarantee a high level of contact reliability.

These auxiliary contacts are suitable for solid-state circuits with currents ≥ 1 mA at a voltage ≥ 17 V.

Connection methods

The 3RT2 contactors are available with screw terminals or spring-type terminals.

Short-circuit protection of the contactors

For short-circuit protection of the contactors without overload relay, see "Technical specifications" (see note).

To assemble fuseless motor feeders you must select combinations of motor starter protector and contactor as explained in "3RA2 Load Feeders".

Motor protection

3RU21 thermal overload relays or 3RB30 electronic overload relays can be fitted to the 3RT2 contactors for protection against overload. The overload relays must be ordered separately.

Ratings of induction motors

The quoted rating (in kW) refers to the output power on the motor shaft (according to the nameplate).

Control supply voltage

The contactors with communication interface are available with 24 V DC operation.

Overview

These 3RA24 contactor assemblies for wye-delta starting are designed for standard applications.

Note:

Contactor assemblies for wye-delta starting in special applications such as very heavy starting or wye-delta starting of special motors must be customized. Help with designing such special applications is available from Technical Assistance.

The 3RA24 contactor assemblies for wye-delta starting can be ordered as follows:

- complete, fully wired and tested, with electrical and mechanical interlocking
- as individual parts for customer assembly

A dead interval of 50 ms on reversing is already integrated in the function module for wye-delta starting. The auxiliary contacts fitted in the contactors (see page 7/10) are freely available.

IO-Link
Contactors and contactor assemblies

**SIRIUS 3RA24 contactor assemblies
for wye-delta starting**

Selection and ordering data (continued)

Components for customer assembly

Assembly kits with wiring modules and mechanical connectors are available for contactor assemblies for wye-delta starting. Contactors, overload relays, function modules for wye-delta starting, auxiliary switches for electrical interlocking – and if required also feeder terminals – must be ordered separately.

The wiring kits for sizes S00 and S0 contain the top and bottom main conducting path connections between the line and delta contactors (top) and between the delta and star contactors (bottom).

Assembly kits for making 3-pole contactor assemblies

3RT20 1	**S00**	The assembly kit contains: mechanical interlock, 4 connecting clips, star jumper, wiring modules on the top and bottom		
		• For main, auxiliary and control circuits	**3RA29 13-2BB1**	**3RA29 13-2BB2**
3RT20 2	**S0**	The assembly kit contains: mechanical interlocking, 4 connecting clips, star jumper, wiring modules on the top and bottom [1]		
		• For main, auxiliary and control circuits	**3RA29 23-2BB1**	**--**
		• Only for main circuit [2]	**--**	**3RA29 23-2BB2**

[1] When using the function modules for wye-delta starting, the wiring modules included in the assembly kit for the auxiliary current are not required.

[2] Version in size S0 with spring-type terminals:
Only the wiring modules for the main circuit are included.
No connectors are included for the auxiliary and control circuit.

▎Overview

The function modules for mounting onto contactors enable the assembly of starters and contactor assemblies for direct-on-line, reversing and wye-delta starting without any additional, complicated wiring of the individual components.

They include the key control functions required for the particular feeder, e.g. timing and interlocking, and can be connected to the controller by IO-Link.

■ **Overview**

① Green LED "DEVICE/IO-Link:
A continuous green light signals that the device is working correctly; green flickering indicates communication via IO-Link.

② Red LED "GND FAULT":
A continuous red light signals ground-fault tripping.

③ Red LED "THERMISTOR":
A continuous red light signals ground-fault tripping.

④ Red LED "OVERLOAD":
A continuous red light signals an active overload trip; a flickering red light signals an imminent trip (overload warning).

⑤ Motor current and trip class setting:
Setting the device to the motor current and required trip class dependent on the start-up conditions is easy with the two rotary switches.

⑥ Selector switch for manual/automatic RESET:
With this switch you can choose between manual and automatic RESET.

⑦ Test/RESET button:
Enables testing of all important device components and functions, plus resetting of the device after a trip when manual RESET is selected.

⑧ Terminals (terminal block removable):
The generously-sized terminals permit connection of two conductors with different cross-sections for the auxiliary, control and sensor circuits. Choice of screw connection and spring-type connection.

⑨ Connection point for operator panel:
Facilitates connection of operator panel 3RA69 35-0A.

SIRIUS 3RB24 evaluation module

SIRIUS 3RB29 06 current measuring module

The modular electronic overload relay 3RB24, which is powered via IO-Link (with monostable auxiliary contacts) up to 630 A (up to 820 A possible with a series transformer) have been designed for inverse-time delayed protection of loads with normal and heavy starting (for "Function" see manual SIRIUS electronic overload relay 3RB24 for IO-Link) against excessive temperature rises due to overload, phase unbalance or phase failure. The evaluation module 3RB24 also offers an engine starter function: The contactors, which are connected via the auxiliary contacts, can also be actuated for operation via IO-Link. In this way, direct, reversing and star-delta starters up to 630 A (or 830 A) can be connected to the controller wirelessly via the IO-Link controller.

An overload, phase unbalance or phase failure result in an increase of the motor current beyond the set rated motor current.

This current rise is detected by means of a current measuring module and electronically evaluated by a special evaluation module which is connected to it. The evaluation electronics sends a signal to the auxiliary contacts. The auxiliary contacts then switch off the load by means of a contactor. The break time depends on the ratio between the tripping current and current setting I_e and is stored in the form of a long-term stable tripping characteristic ("Characteristic Curves" see www.siemens.com/industrial-controls/support). The "tripped" status is signaled by means of a continuously illuminated red "OVERLOAD" LED and also reported as a group fault via IO-Link.

The LED indicates imminent tripping of the relay due to overload, phase unbalance or phase failure by flickering when the current limit has been exceeded. This warning can also be reported to the higher-level PLC via IO-Link at the 3RB24 overload relay.

In addition to the described inverse-time delayed protection of loads against excessive temperature rises, the 3RB24 electronic overload relays also allow direct temperature monitoring of the motor windings (full motor protection) by connection with broken-wire interlock of a PTC sensor circuit. With this temperature-dependent protection, the loads can be protected against overheating caused, for example, indirectly by reduced coolant flow and which cannot be detected by means of the current alone. In the event of overheating, the devices switch off the contactor, and thus the load, by means of the auxiliary contacts. The "tripped" status is signaled by means of a continuously illuminated "THERMISTOR" LED and also reported as a group fault via IO-Link.

To the loads against incomplete ground faults due to damage to the insulation, humidity, condensation, etc., to protect the electronic overload relay 3RB24 offer the possibility of internal ground-fault detection (for details, see 3RB24 SIRIUS electronic overload relay for IO-Link manual, not possible in conjunction with contactor assembly for wye-delta starting). In the event of a ground fault, the 3RB24 relays trip instantaneously.

The "tripped" status is signaled by means of a flashing red LED "Ground Fault" and reported at the overload relay 3RB24 as a group fault via IO-Link.

7

IO-Link
SIRIUS 3RB2 electronic overload relays

3RB24 for IO-Link, up to 630 A
for high-feature applications

■ Overview (continued)

The reset after overload, phase unbalance, phase failure, thermistor or ground-fault tripping is performed manually by key on site, via IO-Link or by electrical remote RESET or automatically after the cooling time (motor model) or for thermistor protection after sufficient cooling. Power cuts in devices due to function monitoring (broken wire or short-circuit on the thermistor) can only be reset on-site (for "Function" see SIRIUS electronic overload relay 3RB24 for IO-Link manual). In conjunction with a function expansion module, the motor current measured by the microprocessor can be output in the form of an analog signal

DC 4 to 20 mA for operating rotary coil instruments or for feeding into analog inputs of programmable logic controllers.

The current values can be transmitted to the higher level controller via IO-Link.

The devices are manufactured in accordance with environmental guidelines and contain environmentally-friendly and reusable materials.

They comply with all important worldwide standards and approvals.

[1] For technical specifications for the use of overload relays with trip class
≥ CLASS 20, see "Short-circuit protection with fuses for motor feeders", see the configuration manual for SIRIUS innovations configuration – selection data for fused and fuseless load feeders and in the configuration manual "Configuring SIRIUS fuseless load feeders."

Connection methods

The 3RB24 electronic overload relays (evaluation modules) can be fitted on the auxiliary current side with screw connection (box terminals) or spring-type connections.

⊕ Screw terminals

⨅ Spring-type terminals

Type of protection "increased safety EEx e and explosion-proof enclosure EEx d" in accordance with ATEX Directive 94/9/EC

The electronic overload relay 3RB24 (monostable) are suitable for the overload protection of explosion-proof motors of types of protection EEx e and EEx d.

They comply with the requirements of EN 60079-7 (Electrical apparatus for areas subject to explosion hazards – Increased safety "e" as well as for flameproof enclosure "d"); see www.siemens.com/industrial-controls/atex.

EC type test certificate for Group II, Category (2)G/D has been submitted. On request.

7

IO-Link
SIRIUS 3RB2 electronic overload relays
**3RB24 for IO-Link, up to 630 A
for high-feature applications**

Application

Industries

The 3RB24 electronic overload relays are suitable for customers from all industries who want to guarantee optimum inverse-time delayed and temperature-dependent protection of their electrical loads (e.g. motors) under normal and heavy starting conditions (CLASS 5 to 30), minimize project completion times, inventories and power consumption, and optimize plant availability and maintenance management.

Application

The 3RB24 electronic overload relays have been designed for the protection of three-phase asynchronous and single-phase AC motors.

In addition to protection function, these devices can be used together with contactors as direct or reversing starters (star-delta (wye-delta) start also possible), which are controlled via IO-Link. This makes it possible to directly control drives via IO-Link from a higher-level controller or on site via the optional hand-held device lamps and also, for example, to return current values directly via IO-Link.

If single-phase AC motors are to be protected by the 3RB24 electronic overload relays, the main current paths of the current measuring modules must be series-connected (see "Circuit diagrams" www.siemens.com/industrial-controls/support).

Ambient conditions

The devices are insensitive to external influences, such as shocks, corrosive ambient conditions, aging and temperature fluctuations.

For the temperature range from –25 °C to +60 °C, the 3RB24 electronic overload relays compensate the temperature in accordance with IEC 60947-4-1.

Configuration notes for use of the devices below –25 °C or above +60 °C on request.

IO-Link
SIRIUS 3RA6 compact feeders

**SIRIUS 3RA64, 3RA65 compact feeders
for IO-Link**

Overview

Communication integration using IO-Link

Up to 4 compact feeders in IO-Link version (reversing and direct-on-line starters) can be connected together and conveniently linked to the IO-Link master through a standardized IO-Link connection. The 4SI SIRIUS electronic modules are used e.g. as IO-Link masters for connection to the SIMATIC ET 200S distributed I/O system.

The IO-Link connection enables a high density of information in the local range.

The diagnostics data of the process collected by the 3RA6 compact feeder, e.g. short-circuit, end of service life, limit position etc., are not only indicated on the compact feeder itself but also transmitted to the higher-level control system through IO-Link.

Thanks to the optionally available operator panel, which can be installed in the control cabinet door, it is easy to control the 3RA6 compact feeder with IO-Link from the control cabinet door.

Note

For general data on 3RA6 compact feeders see Chapter 6 "AS-Interface" --> "3RA6 Compact Feeders--> "General data"

IO-Link
SIRIUS 3RA6 compact feeders

Accessories for compact feeders for IO-Link

■ Overview

**Accessories for SIRIUS 3RA6 compact feeders
in IO-Link version**

The following accessories are available specially for the 3RA64, 3RA65 compact feeders:

- The 4SI SIRIUS electronic module as IO-Link master allows for the simple and economical connection of SIRIUS controls with IO-Link (e.g. up to four groups of 4 compact starters) to the multifunctional SIMATIC ET 200S distributed I/O system.
- Additional connection cables for side-by-side mounting of up to 4 compact feeders
- Operator panel for on-site control and diagnostics of up to 4 compact feeders coupled to each other

Note

For accessories for all SIRIUS 3RA6 compact feeders see Chapter 6 "AS-Interface" --> "3RA6 Compact Feeders" --> "Accessories"

Overview

SIRIUS 3UG48 monitoring relays

The SIRIUS 3UG4 monitoring relays for electronic and mechanical variables monitor all important characteristics that allow conclusions to be drawn about the functionality of a plant. Both sudden disturbances and gradual changes, which may indicate the need for maintenance, are detected.

Thanks to their relay outputs, the monitoring relays permit direct disconnection of the affected system sections and alerting, e.g. by the triggering of a warning light. Thanks to adjustable delay times the 3UG4 monitoring relays can respond very flexibly to brief disturbances such as voltage dips or load changes and can thus avoid unnecessary alarms and disconnections and increase system availability.

3UG48 monitoring relays for IO-Link

The SIRIUS 3UG48 monitoring relays for IO-Link also offer many other options based upon the monitoring functions of the tried-and-tested SIRIUS 3UG4 monitoring relays:

- Measured value transmission to a controller, inc. resolution and unit, may be parametrizable as to which value is cyclically transmitted
- Transmission of alarm flag to a controller
- Full diagnosis capability by inquiry as to the cause of the fault in the diagnosis data set
- Remote parameterization is also possible, in addition to or instead of local parametrization
- Rapid parameterization of the same devices by duplication of the parametrization in the controller
- Parameter transmission by upload to a controller by IO-Link call or by parameter server (if IO-Link master from IO-Link Specification V 1.1 is used)
- Consistent central data storage in the event of parameter change locally or via a controller
- Automatic reparameterizing when devices are exchanged
- Blocking of local parameterization via IO-Link possible
- Faults are saved in parametrizable and non-volatile fashion to prevent an automatic start-up after voltage failure and make sure diagnosis data is not lost
- By connection to the automation level the option exists of parametrizing the monitoring relay at any time via a display unit or displaying the measured values in a control room or locally at the machine/control cabinet.

Even without communication via IO-Link the devices continue to function fully autonomously:

- Parameterization can take place locally at the device, independently of a controller.
- In the event of failure or before the controller becomes available the monitoring relays work as long as the control supply voltage (24 V DC) is present.
- If the monitoring relays are operated without the controller, the 3UG48 monitoring relays have, thanks to the integrated SIO mode, an additional semiconductor output, which switches when the adjustable warning threshold is exceeded.

Thanks to the combination of autonomous monitoring relay function and integrated IO-Link communication, redundant sensors and/or analog signal converters – which previously took over the transmission of measured values to a controller, leading to considerable extra cost and wiring outlay – are no longer needed.

Because the output relays are still present, the monitoring relays increase the functional reliability of the system, since the controller can only fulfill the control tasks if the current measured values are available, whereas the output relays can also be used for the disconnection of the system if limit values that cannot be reached during operation are exceeded.

The individual 3UG48 monitoring relays for IO-Link offer the following functions in different combinations:

- Phase sequence
- Phase failure, neutral conductor failure
- Phase asymmetry
- Undershooting and/or overshooting of limit values for voltage
- Undershooting and/or overshooting of limit values for current
- Undershooting and/or overshooting of limit values for the power factor
- Monitoring of the active current or the apparent current
- Undershooting and/or overshooting of limit values for speed

Note:

Further information on the IO-Link bus system can be found in Catalog IC 10, Chapter 2 "Industrial Communication".

Connection methods

The 3UG48 monitoring relays for IO-Link can be delivered with screw terminals or spring-type terminals.

⊕	Screw terminals
⊟	Spring-type terminals

IO-Link
SIRIUS 3UG48 monitoring relays for stand-alone installation for IO-Link

General data

■ **Benefits**

- Simple cyclical transmission of the current measured values, relay switching states and events to a controller
- Remote parametrization
- Automatic reparameterizing when devices are exchanged
- Simple duplication of identical or similar parameterizations
- Reduction of control current wiring

- Elimination of testing costs and wiring errors
- Reduction of configuration work
- Integration in TIA means clear diagnostics if a fault occurs
- Cost saving and space saving in control cabinet due to the elimination of AI and IO modules as well as analog signal converters and duplicated sensors

■ **Application**

The use of SIRIUS monitoring relays for IO-Link is particularly recommended for machines and plant in which these relays, in addition to their monitoring function, are to be connected to the automation level for the rapid, simple and fault-free provision of the current measured values and/or for remote parametrization.

The monitoring relays can either relieve the controller of monitoring tasks or, as a second monitoring entity in parallel to and independent of the controller, increase the reliability in the process or in the system. In addition, the elimination of AI and IO modules allows the width of the controller to be reduced despite significantly expanded functionality.

■ **Design**

① Message limit violation plus measured value transferred to PLC
② Autonomous function without PLC
③ Message limit violation to PLC

Use of conventional monitoring relays

① Message limit violation plus measured value transferred to PLC
② Autonomous function without PLC

Monitoring relays for IO-Link

Notes:

Devices required for the communication via IO-Link:

- Any controller that supports the IO-Link (e.g. ET 200S with CPU or S7-300 plus ET 200S distributed peripherals, see Catalog ST 70)
- IO-Link master (IO-Link master 4SI IO-Link or 4SI SIRIUS interface module, which can connect all SIRIUS IO-Link devices to a controller, see page 7/4)

Each monitoring relay requires an IO-Link channel.

Overview

SIRIUS 3UG48 15 monitoring relay

Electronic line monitoring relays provide maximum protection for mobile machines, plants and hoisting equipment or for unstable networks. Network and voltage faults can thus be detected early and rectified before far greater damage ensues.

The line monitoring relays with IO-Link monitor phase sequence, phase failure (with or without N conductor monitoring), phase asymmetry and undervoltage and/or overvoltage.

Phase asymmetry is evaluated as the difference between the greatest and the smallest phase voltage relative to the greatest phase voltage. Undervoltage or overvoltage exist if the set limit values for at least one phase are overshot or undershot. The rms value of the voltage is measured.

Benefits

- Can be used in any network from 160 to 630 V AC worldwide thanks to wide voltage range
- Variably adjustable to overshoot, undershoot or range monitoring
- Freely parameterizable delay times and RESET response
- Width 22.5 mm
- Display and transmission of actual value and network fault type to controller
- All versions with removable terminals
- All versions with screw or spring-type terminals

Application

Function	Application
Phase sequence	• Direction of rotation of the drive
Phase failure	• A fuse has tripped
	• Failure of the control supply voltage
	• Broken cable
Phase asymmetry	• Overheating of the motor due to asymmetrical voltage
	• Detection of asymmetrically loaded networks
Undervoltage	• Increased current at a motor with corresponding overheating
	• Unintentional resetting of a device
	• Network collapse, particularly with battery power
Overvoltage	• Protection of a plant against destruction due to overvoltage

SIRIUS 3UG48 monitoring relays for stand-alone installation for IO-Link

Overview

SIRIUS 3UG48 32 monitoring relay

The relays monitor single-phase AC voltages (rms value) and DC voltages against the set limit value for overshoot and undershoot.

Benefits

- Variably adjustable to overshoot, undershoot or range monitoring
- Freely parameterizable delay times and RESET response
- Width 22.5 mm
- Display and transmission of actual value and status messages to controller
- All versions with removable terminals
- All versions with screw or spring-type terminals

Application

- Protection of a plant against destruction due to overvoltage
- Switch-on of a plant at a defined voltage and higher
- Protection against overloaded control supply voltages, particularly with battery power

Selection and ordering data

- Adjustable via IO-Link and locally, with illuminated LCD
- Power supply with 24 V DC via IO-Link or external auxiliary voltage

SIRIUS 3UG48 monitoring relays for stand-alone installation for IO-Link

Power factor and active current monitoring

Overview

SIRIUS 3UG48 41 monitoring relay

The 3UG48 41 power factor and active current monitoring devices enable the load monitoring of motors.

Whereas power factor monitoring is used above all for monitoring no-load operation, the active current monitoring option can be used to observe and evaluate the load factor over the entire torque range.

Benefits

- Monitoring of even small single-phase motors with a no-load supply current below 0.5 A
- Simple determination of threshold values by the direct collection of measured variables on motor loading
- Range monitoring and active current measurement enable detection of cable breaks between control cabinets and motors, as well as phase failures
- Power factor and/or active current can be selected as the measurement principle
- Width 22.5 mm
- Display and transmission of actual value and status messages to controller
- All versions with removable terminals
- All versions with screw or spring-type terminals

Application

- No-load monitoring and load shedding, such as in the event of a V-belt tear
- Underload monitoring in the low performance range, e.g. in the event of pump no-load operation
- Monitoring of overload, e.g. due to a dirty filter system
- Power factor monitoring in networks for control of compensation equipment
- Broken cable between control cabinet and motor

7

IO-Link

SIRIUS 3UG48 monitoring relays for stand-alone installation for IO-Link

■ Overview

SIRIUS 3UG48 51 monitoring relay

3UG48 51 monitoring relays are used together with a sensor to monitor drives for overspeed and/or underspeed.

Furthermore, the relays are ideal for all functions where a continuous pulse signal needs to be monitored (e.g. belt travel monitoring, completeness monitoring, passing monitoring, clock-time monitoring).

■ Benefits

- Variably adjustable to overshoot, undershoot or range monitoring
- Freely parameterizable delay times and RESET response
- Display and transmission of actual value and fault type to controller
- Use of up to 10 sensors per revolution on motors rotating extremely slowly
- 2- or 3-wire sensors and sensors with a mechanical switching output or solid-state-output can be connected
- Auxiliary voltage for sensor integrated
- All versions with removable terminals
- All versions with screw or spring-type terminals

■ Application

- Slip or tear of a belt drive
- Overload monitoring
- Transport monitoring for completeness

7

Speed monitoring

■ **Selection and ordering data**

- For speed monitoring in revolutions per minute (rpm)
- Two- or three-wire sensor with mechanical or electronic switching output can be connected
- Two-wire NAMUR sensor can be connected
- Sensor supply 24 V DC/50 mA integrated
- Input frequency 0.1 to 2 200 pulses per minute (0.0017 to 36.7 Hz)
- With or without enable signal for the drive to be monitored
- Adjustable via IO-Link and locally, with illuminated LCD
- Power supply with 24 V DC via IO-Link or external auxiliary voltage
- Overshoot, undershoot or range monitoring
- Number of pulses per revolution can be adjusted
- Upper and lower limit values can be adjusted separately
- Auto, manual or remote RESET options after tripping
- Permanent display of actual value and tripping state
- 1 CO contact, 1 semiconductor output (in SIO mode)

IO-Link
SIRIUS 3RS14, 3RS15 temperature monitoring relays for IO-Link

Overview

SIRIUS 3RS14, 3RS15 temperature monitoring relays

The temperature monitoring relays for IO-Link are used to measure temperatures in solid, liquid and gas media.

The temperature is calculated using a sensor in the medium, evaluated by the device and monitored up to two limit values for overshooting or undershooting a working range (window function).

In addition to warnings and a trip function in the case of temperature deviations, the devices can also be used as a temperature controller (one-point, two-point or three-point control).

The devices differ from one another in terms of the type and number of connectable temperature sensors.
- 3RS14: Connection for resistance sensor
- 3RS15: Connection for thermoelements

IO-Link
SIRIUS 3RS14, 3RS15 temperature monitoring relays for IO-Link

Relay, digitally configurable for 1 sensor

■ Overview

Digital monitoring relay SIRIUS 3RS14 40 for 1 sensor

The 3RS14 and 3RS15 temperature monitoring relays for IO-Link are used to measure temperatures in solid, liquid and gas media. The temperature is calculated using a sensor in the medium, evaluated by the device and monitored for overshooting or undershooting a working range (range monitoring). The digital temperature monitoring relays have two separately adjustable limit values, are non-volatile and can be operated as desired using the open- or closed-circuit principle.

The devices differ in terms of the number of temperature sensors which can be evaluated. The 3RS14 40 and 3RS15 40 for IO-Link temperature monitoring relays can be digitally adjusted for one sensor and represent an alternative to temperature controllers in the low-end section (two-point or three-point control).

The devices with two-point control can, for example, be used as a thermostat. The devices with three-point control can, for example, independently switch between heating and cooling.

The 3RS14 41 temperature monitoring relays for IO-Link can be digitally configured to evaluate up to three resistance sensors at one time. The devices were designed specifically for monitoring motor windings and positions.

The temperature monitoring relays are powered through the control supply voltages IO-Link (L+) and earth (L-) or via an external 24 V DC power supply.

Monitoring

When the temperature has reached the $\vartheta 1$ limit value, the K1 output relay changes its switching state after the configured time t has expired (output relay K2 reacts accordingly at $\vartheta 2$). The delay time can be adjusted.

The output relays return immediately to their original state once the temperature reaches the respective hysteresis value.

When the temperature has reached the top $\vartheta 1$ limit value, the K1 output relay changes its switching state after the configured time t has expired. The output relay returns immediately to its original state once the temperature reaches the respective hysteresis value.

The K2 output relay reacts in the same way at the $\vartheta 2$ lower threshold. Both limit values $\vartheta 1$ and $\vartheta 2$ can be paramterized for overshooting or undershooting the threshholds. This makes it possible to use a limit value for issuing an alarm signal to announce that a value a limit value is about to be overshot or undershot.

Note:

The "Temperature monitoring mode" parameter can be used to set the desired type of monitoring (monitoring for overshooting or undershooting or range monitoring).

■ Benefits

- Very simple operation without complicated menu selections
- Two- or three-point control can be parametrized quickly
- All versions with removable terminals
- All versions with screw or spring-type terminals

■ Application

The temperature monitoring relays can be used in almost any application in which temperature overshoot or undershoot is not permitted, e.g. in the monitoring of set temperature limits and the output of alarm messages for:

- Plant and environment protection
- Temperature limits for process variables e.g. in the packaging industry or electroplating
- Temperature limits for district heating plants
- Exhaust temperature monitoring
- Controlling equipment and machines such as heating, climate and ventilation systems, solar collectors, heat pumps or warm water supplies
- Motor, bearing and gear oil monitoring
- Monitoring of coolants

7

■ Selection and ordering data

- To monitor temperatures with a resistance sensor or thermo-element
- Temperature range dependent on sensor type
  - 99 to + 1 800 °C or - 146.2 to + 3 272 °F
- Short-circuit and open-circuit detection in sensor circuit
- Adjustable via IO-Link and locally, with illuminated LCD
- Power supply with 24 V DC via IO-Link or external auxiliary voltage
- Overshoot, undershoot or range monitoring
- Exact sensor type can be set
- 2 limit values, can be adjusted separately
- Adjustable open/closed-circuit principle
- Can be adjusted by hand or remote RESET (via an external contact)
- Actual value, tripping state for control displayed and conveyed, adjustable in °C or °F
- 1 CO contact per limit value
- 1 CO contact for monitoring sensors and devices

IO-Link
SIRIUS 3RS14, 3RS15 temperature monitoring relays for IO-Link

Relay, digitally configurable for up to 3 sensors

■ Overview

Digital monitoring relay SIRIUS 3RS14 41 for up to 3 sensors

The 3RS14 temperature monitoring relays can be used to measure temperatures in solid, liquid and gas media. The temperature is calculated using a sensor in the medium, evaluated by the device and monitored for overshooting or undershooting a working range (range monitoring). The devices show the measured temperature in °C or °F. The 3RS14 41 evaluation unit can evaluate up to 3 resistance sensors at one time.

■ Benefits

- Very simple operation without complicated menu selections
- Space-saving with 45 mm width
- Two- or three-point control can be parametrized quickly
- All versions with removable terminals
- All versions with screw or spring-type terminals

■ Application

The 3RS14 41 temperature monitoring relays can be used almost anywhere where several temperatures must be monitored at one time for overshooting, undershooting or staying within a certain range.

Monitoring of set temperature limits and output of alarm messages for:

- Plant and environment protection
- Temperature limits for process variables e.g. in the packaging industry or electroplating
- Controlling equipment and machines such as heating, climate and ventilation systems, solar collectors, heat pumps or warm water supplies
- Motor, bearing and gear oil monitoring
- Monitoring of coolants

Industrial Wireless Communication

Introduction

Overview

Wireless communications offer multiple new opportunities to the industry for the development of highly flexible and efficient automation solutions. Whether Industrial Wireless Telecontrol, IWLAN, or WirelessHART, the Siemens product line for Industrial Wireless Communications is reliable, robust and secure. The components are used under the toughest indoors and outdoors conditions. Their multiple applications in crane systems, automatic guided vehicle systems, or in remote operation / remote maintenance systems are a testimonial to their exceptional reliability.

Further information can be found under the product entries for GSM, GPRS and UMTS modems and routers in the section on Industrial Remote Communication.

Further information on WirelessHART can be found under the product entries for WirelessHART as well as in Catalog FI 01 and at www.siemens.com/wirelesshart

Wireless data transmission via Industrial Wireless TeleControl, Industrial Wireless LAN, and WirelessHART

Overview

SCALANCE W – wireless communication with Industrial Wireless LAN

The SCALANCE W products offer the combination of reliability, ruggedness and security in one product:

- For implementation at industrial and automation customer sites
- For outdoor environments with demanding climatic requirements
- For low-cost integration in the control cabinet or in devices

The Industrial Wireless LAN (IWLAN) technology provides an extension to the IEEE 802.11 standard that is particularly suited to demanding industrial applications with real-time and redundancy requirements. This provides customers with a unique wireless network, both for process-critical data and for uncritical communication. SCALANCE W products distinguish themselves by the reliability of their radio channel and the rugged type of construction with high requirements with respect to mechanical durability for which SIMATIC is known. To protect against unauthorized access, the products provide modern standard mechanisms for user identification (authentication) and encryption of data, and can at the same time be easily integrated into existing security concepts.

Radio infrastructure

Instead of copper cables and fiber-optic cables, wireless transmission techniques use radio waves. The propagation characteristics of the electromagnetic waves can differ considerably and depend on the spatial environment with the installed wireless infrastructure.

SCALANCE W modules use techniques such as antenna switchover (antenna diversity), high-quality receivers and fault-tolerant modulation procedures to enhance reception and to prevent interruption of radio communication. Extensions to the IEEE 802.11 standard also permit reliable, wireless transmission from PROFINET, form the basis for wireless safety applications and the transmission of video data with extremely short reply and update data.

Network solution with IWLAN

With mobile data terminals, for example, a continuous information flow from the management level down to the production level is possible.

The SINEMA E software is available for simplified planning and configuration of an IWLAN network with the help of simulation functions. It visualizes clearly and details wireless and device properties, thus reducing the configuring and startup overhead and helping to avoid configuring errors.

The IWLAN/PB Link PN IO is available for wireless-based connection of PROFIBUS devices.

This means that information can be provided quickly, reliably and easily at the right place and at the right time wirelessly.

Ruggedness and industrial suitability

The SCALANCE W products can be exposed to fluctuations in the extended temperature range, or continuous contact with dust and water. Rugged housing and design protection against shock and vibration enable use in harsh industrial environments.

The accessories such as antennas, power supplies and cabling are also part of this concept and suitable for use in industry.

Power and data are transferred over one cable with Power-over-Ethernet, thus saving investment and maintenance costs.

The swap medium C-PLUG (Configuration Plug) saves configuring data, making device replacement possible in a short time and without specially trained personnel. This minimizes standstill times and saves training costs.

Reliability of data communication

The international standard IEEE 802.11n makes wireless communication via IWLAN even more robust. Maximum benefit derives from using multiple path propagation (**M**ultiple **I**nput, **M**ultiple **O**utput (MIMO)). This allows the devices to use several antennas in parallel. A higher data transfer rate is thus achieved and fault susceptibility in environments with a high number of reflections is reduced.

SCALANCE W products with IWLAN in accordance with IEEE 802.11n support up to three "streams" in the send and receive directions.

Multiple path propagation (MIMO) with SCALANCE W788-1PRO and SCALANCE W788-1 M12

Industrial Wireless Communication
Industrial Wireless LAN (IWLAN)

Introduction

Overview (continued)

Redundant network concepts can also be implemented wirelessly. Wireless channels are designed redundantly for this purpose, with a changeover time of a few milliseconds, so that the application is not influenced by packet repetitions or interference in the radio channel.

No data rate reservation

IEEE 802.11 — Time

Client 1
Client 2
Client 3
Client 4
Client 5
Client 6

This means that access by nodes with critical data cannot be predicted.

All nodes access the radio channel without prioritization.

G_IK10_XX_30178

In standard WLAN, **all stations access** the radio channel in an uncoordinated manner. This means that access by stations with critical data cannot be predicted.

The iPCF function (support from device types with i features) permits cyclic data traffic in real time for several wirelessly linked PROFINET IO devices. In addition, this enables mobile stations to be transferred quickly from one radio field to another (roaming) so that PROFINET IO communication is not interrupted.

Cyclic polling of all nodes within radio coverage

IEEE 802.11 — Time

Client 1
Client 2
Client 3
Client 4
Client 5
Client 6

This means that access by all nodes can be predicted.

All nodes may predictably access the radio channel

G_IK10_XX_30177

However, WLAN also provides a transmission mechanism based on standard WLAN in accordance with IEEE 802.11, which makes a defined data rate available to all stations. This means that access **by all stations** can be predicted.

■ Overview (continued)

Increased transmission rate

WLAN systems in accordance with IEEE 802.11a/b/g/h use a single channel for sending and receiving data. This achieves a maximum gross transmission rate of 54 Mbit/s.

Two channels are used simultaneously with the help of channel bonding. Gross transmission rates of up to 450 Mbit/s can be achieved in conjunction with the MIMO technology in accordance with IEEE 802.11n.

Increased transmission rate on IWLAN in accordance with IEEE 802.11n with the help of channel bonding

■ Benefits

g e get   Designed for Industry

- High level of investment protection, as all products comply with the universally recognized IEEE 802.11 standard and are suitable for 2.4 GHz and 5 GHz

- Wear-free – saves maintenance and repair costs for connectors, trailing cables, sliding contacts or winding devices

- Reliable wireless connection, e.g. due to redundant connection, automatic roaming if there is a break in the cable connection from the access point (forced roaming), cyclic monitoring of the wireless link (link check), or monitoring for IP connections (IP Alive)

- Predictable data traffic (deterministic) and defined response times on the radio link

- Wireless transmission of standard and failsafe signals by means of PROFINET and PROFIsafe

- More economical installation in hazardous areas of Zone 2

- Rapid commissioning thanks to reduced overhead for installing the communication network when using the SINEMA E engineering tool. This provides support for planning, simulating and measuring an IWLAN radio link on-site (site survey)

- Integrated wireless network for data, voice and video beyond corporate divisions thanks to interfacing with the SCALANCE WL**C** IWLAN **c**ontroller (support from SCALANCE W78x**C** device types)

8

Industrial Wireless Communication
Industrial Wireless LAN (IWLAN)

Application examples

Overview

Wireless integration of PROFIBUS segments and PROFINET stations into an existing Industrial Ethernet network

An existing Ethernet network can be expanded by a wireless network without increased overhead.

With this, even an existing PROFIBUS line can be connected via the IWLAN/PB Link PN IO to an access point.

The radio connection is established to the mobile stations by connecting a SCALANCE W access point to the Ethernet network. The mobile stations are connected wirelessly, e.g. via the SCALANCE W746-1PRO Client Module, to which the mobile station is connected with a cable.

Access to the existing controllers or processes is possible without an excessive additional wiring overhead.

8

■ **Overview** (continued)

Uninterruptible roaming between the office and automation network by using wireless LAN controllers and industrial wireless LAN controllers

By using the SCALANCE WLC Industrial Wireless LAN Controller together with controller-based access points, it is possible to establish a single wireless infrastructure for the entire company. This achieves a high level of flexibility, as mobile stations (e.g. laptop, PDA, WLAN telephone) can move anywhere, switching seamlessly between the office and automation networks (roaming). This allows wireless access to data from any location within the company. Thanks to the use of a centralized security mechanism for each user group (Virtual Network Services VNS), the data here is protected against unauthorized access and manipulation.

The SCALANCE W78xC controller-based access points support the WLAN standards IEEE 802.11a/b/g and 802.11n, and they are connected via Gigabit Ethernet to the SCALANCE WLC IWLAN Controller.

The SCALANCE W786-2HPW controller-based access points support the WLAN standards IEEE 802.11a/b/g, and they are connected via Fast Ethernet to the SCALANCE WLC IWLAN Controller.

Operation always requires the SCALANCE WLC IWLAN Controller, which permits the configuration of access points in groups. This significantly increases the manageability of an extensive IWLAN infrastructure. Central management with the IWLAN controller also permits fault recording, monitoring and documentation of statistics.

8

Application examples

Overview (continued)

Wireless solutions with RCoax cable are typically used in the following applications:

- Crane control
- Overhead monorail conveyors
- Storage and retrieval systems
- Automated guided vehicle systems (AGVS)

An example of an application with a suspended monorail is a nutrunner controller in a car assembly plant.

An RCoax radiating cable is used along the coding rail to establish wireless data transfer between the monorail and the central controller. It generates a defined, spherical and reliable wireless field and is easy to lay.

The RCoax Cable is connected as an antenna to a stationary SCALANCE W788-1RR access point. This means the same mobile unit can be used for all applications and so a mobile nutrunner can be used for several cycles resulting in lower investment costs.

Maintenance costs and downtimes are reduced by reliable wireless and therefore wear-resistant data transmission to mobile communication partners

Downtimes are reduced because in the event of a fault, devices can be replaced without a programming device or specialist personnel by using the swap medium C-PLUG.

System solution for nutrunner controls with RCoax cable and SCALANCE W747-1RR

8

Overview (continued)

Fail-safe communication with PROFIsafe – via PROFIBUS, PROFINET and even wirelessly via Industrial Wireless LAN

Programming of robots in the safety-related environment

For a number of years, standard automation has incorporated safety engineering - on the basis of SIMATIC S7 controllers, PROFIBUS and PROFIsafe.

This range has been expanded by PROFINET-enabled components, thus providing a complete product range with fail-safe controllers, fails I/O and a corresponding engineering environment.

PROFIsafe prevents errors such as address corruption, loss, delay, etc. when transmitting messages through continuous numbering of the PROFIsafe data, time monitoring, and authenticity monitoring using passwords and optimized CRC backup.

Fail-safe communication is thus also supported via industrial wireless LAN.

Function overview of the SCALANCE W client modules in accordance with IEEE 802.11a/b/g standard

8

G_IK10_XX_30184

Overview

The Access Points of the SCALANCE W780 product line are ideally suited for setting up Industrial Wireless LANs (IWLAN) for 2.4 GHz or 5 GHz. They can be used in all applications that require a high degree of operational reliability, even in extremely harsh ambient conditions.

- High transmission rates (up to 450 Mbit/s in conjunction with Channel Bonding) due to 3x3 MIMO technology (**M**ultiple **I**nput, **M**ultiple **O**utput);
for this purpose, SCALANCE W Access Points use three streams each for simultaneous sending and receiving

- Suitable for any application:
  - SCALANCE W788 RJ45 for installation in a control cabinet
  - SCALANCE W788 M12 for cabinet-free installation indoors
  - SCALANCE W786 for outdoor environments with demanding climatic requirements

- Reliable thanks to rugged, impact-resistant housing, protected from water and dust (IP65), resistant to shock, vibration and electromagnetic fields

- Complex applications with redundancy requirements and high bandwidths, e.g. for video, by using IEEE 802.11n

- Configuration support by means of wizards and online help; easy management via web server and SNMP

- Fast replacement of devices in event of failure by means of optional C-PLUG (**C**onfiguration **P**lug)

Benefits

g e get   Designed for Industry

- Reliable radio link, e.g. by using MIMO technology and monitoring of the radio link

- Cost savings due to one single radio network both for process-critical data and for non-critical communication

- Investment security because all products are compatible with the internationally recognized WLAN standard IEEE 802.11, suitable for the unlicensed frequency bands of 2.4 GHz and 5 GHz (ISM bands)

- Implementation of data-intensive applications such as video streaming through the support of the IEEE 802.11n standard including Channel Bonding

- Reduced operating costs, because there is no wear of rotating and moving plant sections

- Cost-effective connection to devices which are remote, difficult to access or mounted in hostile environments

Application

The Access Points of the SCALANCE W780 product line are designed for both industrial use and for demanding climatic requirements outdoors. Versions for low-cost integration in cabinets are also available. They offer a reliable radio connection, versatile redundancy mechanisms, and fast transfer of stations from one access point to the next (roaming). In this manner, processes can be monitored and production failures through machine downtimes avoided.

Due to the high degree of protection (IP65) and the extended temperature range from -40 °C to +60 °C, the Access Points are ideally suited for use in the outdoor area. SCALANCE W products are silicone-free and can therefore also be used in paint shops.

When using the RCoax cable (radiating cable), operation is particularly reliable in conveying technology and all track applications (e.g. storage and retrieval systems).

SCALANCE W786 versions are available with internal antennas for demanding environmental requirements.

8

Industrial Wireless Communication
IWLAN – Access Points IEEE 802.11n

Overview

■ **Application** (continued)

Application examples:

- Automated guided vehicle systems (AGVS) and suspended monorails;
  prevention of wear and high flexibility in the choice of route thanks to wireless transmission of data to the vehicles

- Crane;
  high flexibility through access to data communication with the moving unit independent of the location

- Mobile control console;
  reliable intervention in the process thanks to data communication over IWLAN with mobile units (e.g. Mobile Panel 277(F) IWLAN); the number of operator panels is therefore determined by the number of personnel and no longer by the number of control desks.

- Wireless access to field devices for configuration and testing

- Passenger transportation systems;
  transmission of high-quality video streams between the control center and buses or trains.

- Tunnel application;
  reliable radio link since the devices can handle multiple path propagation better by using the MIMO technology.

- Communication with moving stations (e.g. mobile controls and devices), container logistics, storage and retrieval machines, conveyor systems, conveyor belts, rotating machines, trucks

- Wireless coupling of communication segments and bridging of large distances for fast commissioning and for cost-effective networks in which cable routing would be extremely expensive (e.g. on public roads, rivers, lakes, train lines)

Multiple path propagation (MIMO) with SCALANCE W788-1PRO and SCALANCE W788-1 M12

Industrial Wireless Communication
IWLAN – Access Points IEEE 802.11n

Design

- Radio card (compatible with IEEE 802.11a/b/g/h/n) permanently installed in the device
- Designed without rotating parts (operation without fans)
- Antennas can either be connected by means of a screw connection (R-SMA, N-Connect) or they are integrated in the device
- Function LEDs for optical signaling of faults and operating states
- 1x PLUG slot

Function

A simple radio link can be established with a single Access Point (infrastructure mode). The Access Point provides an Industrial Ethernet interface for connection to the wireline network. Stations such as mobile controllers or a Field PG can move freely within the radio link and exchange data with other stations through this Access Point.

If the radio link of a single Access Point (radio cell) is insufficient, it can be expanded by further Access Points. The individual radio cells must overlap so that moving stations can be passed seamlessly from one Access Point to the next (roaming). This is performed invisibly to the application. The Access Points must be able to exchange data via Industrial Ethernet or a Wireless Distribution System (WDS).

If the Access Points are not connected to Industrial Ethernet using a wired connection (e.g. no cable tray available for data line), the operating mode "Wireless Distribution System" must be selected. An Access Point from the SCALANCE W780 product line can communicate via WDS with up to eight other Access Points which are not connected to the data network by a direct wired connection. Directional additional antennas can be used to achieve ranges of several thousand meters outdoors.

Apart from a reliable radio link, the SCALANCE W780 Access Points are characterized by their support of IT mechanisms:

- IEEE 802.11a/b/g/n for different frequency ranges
- IEEE 802.11h for use in the 5 GHz range outdoors
- IEEE 802.11e for Wireless Multimedia (WMM)
- IEEE 802.11i for security
- Construction of redundant networks with the Rapid Spanning Tree Protocol (RSTP)
- Virtual networks (VLAN) to logically separate, for example, different user groups
- Sending the log entries of the SCALANCE W devices to a Syslog server
- Modern security mechanisms (e.g. network security such as IEEE 802.1x, RADIUS, EAP mechanisms)
- In client mode:
  Network and Port Address Translation (NAT/PAT): Mapping of private IP addresses and ports to public addresses

Security

A high degree of data security is achieved by means of the WPA2/IEEE 802.11i mechanisms. These define modern procedures that control a regular exchange of the complete 128-bit code as well as performing the access check (authentication) of a station. The Advanced Encryption Standard (AES) is available for data encryption.

Access to the devices (HTTPS) is encrypted and secure logon (SSH) is possible. If a security concept with Virtual Private Networks (VPN) or the SCALANCE S range is required, the products can be integrated without any difficulty.

Diagnostics and management

- Web-based (HTTP/HTTPS) management tool for configuration and diagnostics using a standard browser
- LEDs for signaling operating states and fault conditions
- Signaling of faults by means of SNMP trap or e-mail to a network management tool, e.g. SINEMA-Server

8

Industrial Wireless Communication
IWLAN – Access Points IEEE 802.11n

Overview

- Especially suitable for applications where the access point is to be mounted in the control cabinet
- Low-cost alternative for use indoors with less severe environmental conditions
- The rugged aluminum enclosure with degree of protection IP30 nevertheless provides protection against mechanical and electromagnetic stress in industrial areas

Design

- Rugged aluminum enclosure, shock and vibration-proof, for high mechanical requirements
- Dust protection with IP30 degree of protection
- For use at ambient temperatures from -20 °C to +60 °C
- Resistant to condensation
- Design suitable for installation in control cabinet
- 3 x R-SMA sockets for the connection of remote antennas (6 x R-SMA sockets for the versions with two wireless modules)
- Antenna placement optimized for the 3x3 MIMO technology; the antennas do not interfere with each other when they are mounted direct on the device
- 1 x RJ45 connection for 10/100/1000 Mbit/s with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- 2 x 24 V DC connection for redundant power infeed
- 1 x PLUG slot
- Function LEDs for optical signaling of faults and operating states
- Digital input for feeding in a signal from a sensor, for example, to an SNMP-based network management system
- Digital output for converting a command received over SNMP into a signal and switching a hardware function
- Mounting: Wall, S7 mounting rail or on 35 mm standard mounting rail

Design and interfaces of the SCALANCE W788-2 RJ45 Access Points

Product versions

SCALANCE W788-1 RJ45
- A wireless card permanently installed in the device

SCALANCE W788-2 RJ45
- Two wireless cards permanently installed in the device

Function

SCALANCE W788 RJ45 access points can also be operated as client modules. As an alternative, the SCALANCE W748 RJ45 Client Modules can be used for this mode.

In combination with the SCALANCE W748 RJ45 Client Modules with degree of protection IP30, an infrastructure can be set up in which great temperature differences and protection against dust and water play a somewhat less prominent role.

Industrial Wireless Communication
IWLAN – Access Points IEEE 802.11n
SCALANCE W788 M12 for the indoor area

Overview

- Particularly suitable for industrial applications without control cabinets

Design

- Rugged aluminum enclosure, shock and vibration-proof, for high mechanical requirements
- High IP65 degree of protection against dust and water jets
- For use at ambient temperatures from -20 °C to +60 °C
- Resistant to condensation
- 3 x N-Connect sockets for the connection of remote antennas (6 x N-Connect sockets for the versions with two radio modules)
- Antenna placement optimized for the 3x3 MIMO technology; the antennas do not interfere with each other when they are mounted direct on the device
- 1 x M12 connection for 10/100/1000 Mbit/s with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- 1 x M12 socket for energy supply (24 V DC)
- 1 x PLUG slot
- Function LEDs for optical signaling of faults and operating states
- Mounting: Wall, S7 mounting rail or on 35 mm standard mounting rail

Design and interfaces of the SCALANCE W788-2 M12 Access Points

Product versions

SCALANCE W788-1 M12
- A radio card permanently installed in the device

SCALANCE W788-2 M12
- Two radio cards permanently installed in the device

Function

The devices can be installed at the location that is most favorable for the radio link. The housing and the connectors resist high levels of shock and vibration loading because all the connections are screwed or latched. To achieve optimal illumination for special applications, the supplied antennas can be replaced.

SCALANCE W788 M12 Access Points can also be operated as client modules. As an alternative, the SCALANCE W748 M12 client modules can be used for this mode.

The devices with two interfaces have two separate radio modules and behave like two separate devices in the radio network. This feature can be used to implement cost-effective solutions, e.g. when a radio interface is used for wireless connection of a distant production site and the second radio interface provides a radio link at the Access Point. Local stations can log in here and move around freely. Two separate radio modules, however, also permit the setup of redundant radio links so that a high level of availability can be achieved.

Roaming of moving units (e.g. Field PG and mobile controller) in a radio network with two Access Points

Stations, e.g. a Field PG M, can move freely in the RF field of the SCALANCE W788-1 M12 Access Points for mobile HMI. In addition, SCALANCE W748-1 M12 Client Modules connect mobile units with HMI, controller and PC wirelessly to the data network.

Provided that a delay (several 100 ms) caused by roaming in accordance with IEEE 802.11 is tolerated by all communication stations when switching the radio cells, the communication continues uninterrupted.

The Dual Access Point, SCALANCE W788-2 M12, can provide two separate radio links. For example, a Field PG can use one radio link for configuration. For a clear separation of the applications, the communication that is required for the application, e.g. S7 communication with a controller, can take place via the second radio link.

Industrial Wireless Communication
IWLAN — Access Points IEEE 802.11n

SCALANCE W788 M12 for the indoor area

■ **Ordering data** | Order No. | | Order No.

SCALANCE W788 M12 Access Points

IWLAN access points with built-in radio interfaces; radio networks IEEE 802.11a/b/g/h/n at 2.4/5 GHz up to 450 Mbit/s; WPA2/AES; Power over Ethernet (PoE), IP65 degree of protection (-20 °C to +60 °C); scope of supply: Mounting hardware; manual on CD-ROM, German/English

SCALANCE W788-1 M12

IWLAN Access Point with one built-in radio interface
- National approvals for operation outside the USA — **6GK5 788-1GD00-0AA0**
- National approvals for operation within the USA[1] — **6GK5 788-1GD00-0AB0**

SCALANCE W788-2 M12

IWLAN Dual Access Point with two built-in radio interfaces
- National approvals for operation outside the USA — **6GK5 788-2GD00-0AA0**
- National approvals for operation within the USA [1] — **6GK5 788-2GD00-0AB0**

Accessories

C-PLUG — **6GK1 900-0AB00**

Swap medium for simple replacement of devices in the event of a fault; for storing configuration data; can be used in SIMATIC NET products with PLUG slot

DIN rail mounting adapter — **6GK5 798-8ML00-0AB3**

DIN rail mounting adapter for SCALANCE W788 M12 and SCALANCE W788 RJ45; screw fixing for mounting on a 35 mm DIN rail to EN 50 022; scope of supply: 3 units per pack

IE FC M12 Plug PRO 4 x 2

M12 plug-in connector suitable for on-site assembly (X-coded, IP65/IP67), metal enclosure, insulation/displacement fast connection method, for SCALANCE W
- 1 unit — **6GK1 901-0DB30-6AA0**
- 8 units — **6GK1 901-0DB30-6AA8**

IE FC Standard Cable GP 4 x 2 — **6XV1 878-2A**

8-core, shielded TP installation cable for connection to IE FC RJ45 Plug 4 x 2 and IE M12 Plug PRO 4 x 2; PROFINET-compliant; with UL approval; sold by the meter; max. length 1000 m, minimum order 20 m

IE FC Stripping Tool — **6GK1 901-1GA00**

Preadjusted stripping tool for fast stripping of the Industrial Ethernet FC cables

Antennas and miscellaneous IWLAN accessories — see Industrial Wireless LAN/ accessories

Overview

- Especially well suited to applications with high climatic requirements when installed outdoors and in areas accessible to the public

Design

- Rugged plastic enclosure (plexi-glass type), shock and vibration-proof for severe mechanical loading
- High IP65 degree of protection against dust and water jets
- For use at ambient temperatures from -40 °C to +60 °C
- Resistant to condensation
- Resistant to UV radiation and saltwater spray
- Design for use outdoors
- 3 x R-SMA sockets for the connection of remote antennas (6 x R-SMA sockets or six internal antennas for the versions with two wireless modules)
- Version with 1 x RJ45 connection for 10/100/1000 Mbit/s with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- Version with two slots for SFP plug-in transceivers (optical 2-port switch)
- 1 x 24 V DC connection, optional operation with 12 to 24 V DC or 100 to 240 V AC with power supply integrated into device
- 1 x PLUG slot
- Function LEDs for optical signaling of faults and operating states
- Mounting: Wall or, with optional mounting set, on S7 mounting rail, 35 mm standard mounting rail, or on a pole

Design and interfaces of the SCALANCE W786 access points

Product versions

SCALANCE W786-1 RJ45

- A wireless card permanently installed in the device

SCALANCE W786-2 RJ45

- Two wireless cards permanently installed in the device
- Versions with:
  - Six internal antennas
  - Six connections for external antennas

SCALANCE W786-2 SFP

- Two wireless cards permanently installed in the device

SCALANCE W786 RJ45 for the outdoor area

Function

In the case of access points with two wireless modules, one module implements communication of the access points with each other. The wireless field for the station, e.g. an automated guided vehicle, is established by the second wireless module. Wireless coverage of larger areas can therefore be provided with the same device.

If the minimum length of standard Ethernet cables is insufficient due to the large distance of the access points from the wired network, SCALANCE W-786 can also be used in a version with SFP plug-in transceivers. Depending on the optical SFP plug-in transceiver used, ranges of up to 120 km can then be achieved.

Use of the SCALANCE W786 product line in sectors subject to high climatic requirements

In the case of SCALANCE W786, this only concerns access points which can, however, be configured as client modules through Web-based management. Then, depending on the selected versions, a maximum of one wireless module will be available as a client.

SCALANCE W786 access points

		Accessories	

IWLAN access points with built-in radio interfaces; radio networks IEEE 802.11a/b/g/h/n at 2.4/5 GHz up to 450 Mbit/s; WPA2/AES; Power over Ethernet (PoE), IP65 degree of protection (-40°C to +60°C); scope of supply: Mounting hardware, 2-pin screw terminal for 24 V DC; manual on CD-ROM; German/English

C-PLUG — 6GK1 900-0AB00

Swap medium for simple replacement of devices in the event of a fault; for storing configuration data; can be used in SIMATIC NET products with PLUG slot

SCALANCE W786-1 RJ45

IWLAN access points with <u>one</u> integrated wireless interface and RJ45 connection
- Connections for two external antennas
  - National approvals for operation outside the USA — 6GK5 786-1FC00-0AA0
  - National approvals for operation within the USA [1] — 6GK5 786-1FC00-0AB0

Power supply PS791-2DC — 6GK5 791-2DC00-0AA0

24 V DC power supply for installation in SCALANCE W786 products; operating instructions in German/English

Power supply PS791-2AC — 6GK5 791-2AC00-0AA0

110 V AC to 230 V AC power supply for installation in the SCALANCE W786 products; operating instructions in German/English

SCALANCE W786-2IA RJ45

IWLAN access points with <u>two</u> integrated wireless interfaces and RJ45 connection
- Six internal antennas
  - National approvals for operation outside the USA — 6GK5 786-2HC00-0AA0
  - National approvals for operation within the USA [1] — 6GK5 786-2HC00-0AB0

MS1 mounting set — 6GK5 798-8MG00-0AA0

Mounting set for fixing the SCALANCE W786 products onto an S7-300 mounting rail or a 35 mm standard DIN rail

SCALANCE W786-2 RJ45

IWLAN access points with <u>two</u> integrated wireless interfaces and RJ45 connection
- Six connections for external antennas
  - National approvals for operation outside the USA — 6GK5 786-2FC00-0AA0
  - National approvals for operation within the USA [1] — 6GK5 786-2FC00-0AB0

IE FC RJ45 Plug 4 x 2

RJ45 plug connector for Industrial Ethernet (10/100/1000 Mbit/s) with a rugged metal enclosure and integrated insulation displacement contacts for connecting Industrial Ethernet FC installation cables; 180° cable outlet; for network components and CPs/CPUs with Industrial Ethernet interface
- 1 pack = 1 unit — 6GK1 901-1BB11-2AA0
- 1 pack = 10 units — 6GK1 901-1BB11-2AB0
- 1 pack = 50 units — 6GK1 901-1BB11-2AE0

SCALANCE W786-2 SFP

IWLAN access points with <u>two</u> integrated wireless interfaces and RJ45 connection
- Six internal antennas
  - National approvals for operation outside the USA — 6GK5 786-2FE00-0AA0

Overview

The network infrastructures in the industrial and office areas are coming ever-closer together. This applies also in the area of wireless communication, causing a constant increase in the number of access points and WLAN clients to be managed. If such networks are established with a large number of stand-alone access points, with each one having to be configured separately, this results in huge costs for initial configuration and operation.

Central wireless LAN controllers enable low-cost, user-friendly and secure operation of large WLAN infrastructures here. Management of the WLAN clients connected to such WLANs is significantly simplified thanks to their division into user groups with different security policies.

The SCALANCE WLC711 Wireless LAN Controller is an IWLAN controller for centralized management of a wireless LAN in the industrial environment (configuration, diagnostics, firmware updates, access control, security settings, coordination).

- Fast establishment of a new WLAN or expansion of an existing WLAN with the help of the SCALANCE W786C, SCALANCE W788C and SCALANCE W786-2HPW controller-based access points
- Parallel operation of different services (e.g. communication between programmable controllers, Internet access, Voice-over-IP telephony and video transmission) on the same controller-based WLAN infrastructure
- Seamless transition between production WLAN and corporate WLAN
- Cost savings in commissioning and operation as well as increased reliability and security thanks to the central management functions of the IWLAN controller in comparison to a WLAN comprising stand-alone access points that have to be configured individually

Benefits

get **Designed for Industry**

- Cost reductions and thus significant cost savings in commissioning and operating larger IWLAN installations (ten access points and more) thanks to configuring from a central location
- Investment protection thanks to seamless integration into existing IWLAN installations or into an existing corporate WLAN
- Saving on redundant infrastructures (e.g. separate network for Internet access and voice transmission) thanks to multiple use of the same infrastructure for different services
- Avoidance of a single point of failure thanks to optional parallel operation of two controllers; the WLAN remains functional even if the controller(s) fail(s)
- Increased reliability when operating the IWLAN through complete, coordinated portfolio of controllers, industrial access points and SCALANCE W Client Modules, as well as the suitable accessories (antennas, connecting cables, power supplies)

8

Industrial Wireless Communication
IWLAN – Controller and Controller Access Points IEEE 802.11n

Overview

■ **Application**

Company-wide WLAN based on Enterasys Wireless Controller and SCALANCE WLC IWLAN Controller

The SCALANCE WLC711 IWLAN Controller is the optimal solution for IWLAN installations from 10 up to 32 access points. Through the use of the SCALANCE W Access Points and Client Modules, different applications in the industrial environment or a comparable environment can communicate via a centrally managed IWLAN. SCALANCE W Access Points for controller operation are available for use both outdoors and for cabinet-free use in the industrial environment (e.g. in the production hall).

The WLC711 IWLAN Controller can be integrated into the corporate WLAN and thus enables the implementation of an integrated WLAN in the office, outdoor and industrial areas. This allows operation of mobile WLAN phones and laptops in the same wireless network, while complying with security policies for different user groups, and guaranteeing defined quality of service (QoS) for different devices.

8

■ Application (continued)

Application examples

With the SCALANCE WLC711 IWLAN Controller, the benefits of a controller solution, long-familiar in corporate networks, now also become available to typical industrial and industry-related applications:

- Plant-wide wireless infrastructures in factory automation and process automation, e.g. for mobile operator input or logistics applications
- Industry-related applications, e.g. crane systems and road/ underground rail tunnels where IWLAN is required for transmitting visualization, video, and voice data

SCALANCE WLC711 IWLAN Controller in redundancy mode

■ Design

WLC711 IWLAN Controller

- 24 V DC power supply
- Enclosure in the design of the SIMATIC Microbox IPC, in degree or protection IP20 for installation in the control cabinet
- Two 10/100/1000 Mbit/s electrical RJ45 ports
- DIN rail and wall mounting possible
- Ambient temperature in operation 5 °C to 40 °C

Controller-based access points

- Radio card permanently installed in the device
- Versions available that support the WLAN standards IEEE 802.11a/b/g/n and IEEE 802.11a/b/g
- Versions available with RJ45 electrical port and BFOC optical port
- Antennas can either be connected by means of a screw connection (R-SMA, N-Connect) or they are integrated in the device. The antennas can be replaced within the IWLAN range
- Function LEDs for optical signaling of faults and operating states

Industrial Wireless Communication
IWLAN – Controller and Controller Access Points IEEE 802.11n

Overview

Function

Fundamental principles of the controller-based Industrial Wireless LAN

The IWLAN controller enables centralized management of an Industrial Wireless LAN. It automatically detects new access points, establishes the connection to these, and manages and coordinates access points and clients. Thanks to the Layer 3 architecture, access points located in different Layer 2 subnetworks can also be managed. This function allows wireless expansion of an existing Ethernet network without having to make changes to the existing network topology.

With the IWLAN controller, the IWLAN wireless infrastructure can be divided into logical, service-based networks (**V**irtual **N**etwork **S**ervices). Different services, security requirements and access criteria can thus be reliably managed, and different user groups such as administrators, commissioning engineers, or visitors can use the same wireless network.

In the same way, different applications such as Voice-over-IP (VoIP), video and Internet access can use the same infrastructure. The result is optimal capacity utilization of the IWLAN network.

If applications with high reliability and availability requirements are to communicate wirelessly, two IWLAN controllers can be operated redundantly.

The controller-based access points of the SCALANCE W78xC series can only be used with the IWLAN controller and can only be configured using the IWLAN controller.

The IWLAN controller connects, manages and coordinates all access point and clients such that the WLAN environment appears like several IP subnetworks with central management. The individual connections are additionally managed here, and the stations can therefore move securely and reliably throughout the complete radio network.

Diagnostics and management functions

As well as centralized management and wireless network configuration, the WLC711 IWLAN controller also offers error recording, wireless network monitoring, and documentation of network statistics.

More information

Supplementary WLAN solutions for office environments can be found on the Internet at:
www.enterasys.com

**Industrial Wireless LAN Controller
SCALANCE WLC711**

Overview

- Support for up to 32 access points in standard operation
- Support for up to 64 access points in redundant operation with two IWLAN controllers
- Supplied with license for 16 access points; expandable with license to 32 access points in standard operation
- Simultaneous support for up to 512 WLAN clients
- Support for up to 8 VNS segments
- Automatic detection of new access points
- Support for the SCALANCE W78xC controller-based access points (IEEE 802.11a/b/g/n) and W786-2HPW (IEEE 802.11a/ b/ g)

Application

Controller-based IWLAN for applications with a large number of access points, e.g. in a container terminal

Controller Access Points
SCALANCE W788C RJ45 for control cabinet

Overview

- SCALANCE W788C-2 RJ45 controller-based access points can only be operated on the SCALANCE WLC IWLAN Controller
- Support for the WLAN standard IEEE 802.11n, 3x3 MIMO (compatible with IEEE 802.11a/b/g/h)
- Especially suitable for applications where the access point is to be mounted in the control cabinet
- Low-cost alternative for use indoors with less severe environmental conditions
- The rugged aluminum enclosure with degree of protection IP30 nevertheless provides protection against mechanical and electromagnetic stress in industrial areas

Design

- Rugged aluminum enclosure, shock and vibration-proof, for high mechanical requirements
- Dust protection with IP30 degree of protection
- For use at ambient temperatures from -20 °C to +60 °C
- Resistant to condensation
- Design suitable for installation in control cabinet
- Two built-in wireless cards
- 6 x R-SMA (female) sockets for the connection of remote antennas
- Antenna placement optimized for the 3x3 MIMO technology; the antennas do not interfere with each other when they are mounted direct on the device
- 1 x RJ45 connection for 10/100/1000 Mbit/s with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- 2 x 24 V DC connection for redundant power infeed
- Mounting: Wall, S7 mounting rail or on 35 mm standard mounting rail

Design and interfaces of the SCALANCE W788C-2 RJ45 controller-based access points

Product versions

SCALANCE W788C-2 RJ45 (controller-based)

- Two wireless cards permanently installed in the device

Industrial Wireless Communication
IWLAN – Controller and Controller Access Points IEEE 802.11n

Controller Access Points
SCALANCE W788C M12 for the indoor area

Overview

- SCALANCE W788C-2 M12 controller-based access points can only be operated on the SCALANCE WLC IWLAN Controller
- Support for the WLAN standard IEEE 802.11n, 3x3 MIMO (compatible with IEEE 802.11a/b/g/h)
- Particularly suitable for industrial applications without control cabinets

Design

- Rugged aluminum enclosure, shock and vibration-proof, for high mechanical requirements
- High IP65 degree of protection against dust and water jets
- For use at ambient temperatures from -20 °C to +60 °C
- Resistant to condensation
- 6 x N-Connect (female) sockets for the connection of remote antennas
- Antenna placement optimized for the 3x3 MIMO technology; the antennas do not interfere with each other when they are mounted direct on the device
- 1 x M12 connection for 10/100/1000 Mbit/s with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- 1 x M12 socket for energy supply (24 V DC)
- Mounting: Wall, S7 mounting rail or on 35 mm standard mounting rail

Design and interfaces of the SCALANCE W788C-2 M12 controller-based access points

Product versions

SCALANCE W786C-2 M12 (controller-based)
- Two wireless cards permanently installed in the device

Technical specifications

Order No.	6GK5 788-2GD00-1AA0
Product type designation	**SCALANCE W788C-2 M12**
Transmission rate	
Transmission rate	
• with W-LAN, maximum	450 Mbit/s
• with Industrial Ethernet	10 … 1 000 Mbit/s
• Note	-
Interfaces	
Number of electrical connections	
• for network components or terminal equipment	1
• for power supply	1
• for redundant power supply	1
Design of electrical connection	
• for network components or terminal equipment	M12 interface (8-pin, A-coded), PoE
• for power supply	M12 interface (4-pin, A-coded), PoE
Number of optical connections for fiber-optic cables at 100 Mbit/s	-
Design of optical connection for fiber-optic cables at 100 Mbit/s	-

Overview

- SCALANCE W786C-2 controller-based access points can only be operated on the SCALANCE WLC IWLAN Controller
- Support for the WLAN standard IEEE 802.11n, 3x3 MIMO (compatible with IEEE 802.11a/b/g/h)
- Especially well suited to applications with high climatic requirements when installed outdoors and in areas accessible to the public

Design

- Rugged plastic enclosure (plexi-glass type), shock and vibration-proof for severe mechanical loading
- High IP65 degree of protection against dust and water jets
- For use at ambient temperatures from -40 °C to +60 °C
- Resistant to condensation
- Resistant to UV radiation and saltwater spray
- Design for use outdoors
- 6 x R-SMA sockets for the connection of remote antennas or six internal antennas
- Version with 1 x RJ45 connection for 10/100/1000 Mbit/s with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- 1 x 24 V DC connection, optional operation with 12 to 24 V DC or 100 to 240 V AC with power supply integrated into device
- Mounting: Wall or, with optional mounting set, on S7 mounting rail, 35 mm standard mounting rail, or on a pole

Industrial Wireless Communication
IWLAN – Access Points IEEE 802.11a/b/g

Overview

■ Overview

The access points of the SCALANCE W780 product line are optimized for the configuration of Industrial Wireless LAN (IWLAN) wireless networks for 2.4 GHz or 5 GHz with data transmission rates up to 54 Mbit/s. They can be used in all applications that require a high degree of operational reliability, even under extremely harsh environmental conditions.

- Suitable for any application:
  - SCALANCE W784 for installation in a cabinet or integration in devices
  - SCALANCE W788 for cabinet-free installation indoors
  - SCALANCE W786 for outdoor environments with demanding climatic requirements
- Reliable thanks to rugged, impact-resistant housing, protected from water and dust (IP65), resistant to shock, vibration and electromagnetic fields
- Approved for operation in hazardous areas in Zone 2
- Demanding applications with real-time and redundancy requirements, such as PROFINET with PROFIsafe
- In conformance with standards, as it supports IEEE 802.11; expansions with software functions, especially for applications demanding high reliability, e.g. channel hopping procedure (iHOP), cyclic real-time data traffic, and very high-speed roaming (iPCF)
- Support with planning, simulation, configuration, site survey and documentation with the SINEMA E engineering tool, wizards and online help; easy management with Web server and SNMP
- Quick commissioning of Access Points with the optional swap medium PRESET-PLUG and quick device exchange in case of faults with the optional swap medium C-PLUG (Configuration Plug)

■ Benefits

get **Designed for Industry**

- Predictable data traffic (strict real-time requirements) and defined response times on the wireless link
- Reliable wireless link, e.g. due to redundant connection and cyclic monitoring of the wireless path
- Cost savings due to one single radio network both for process-critical data and for non-critical communication
- Investment security because all products are compatible with the internationally recognized WLAN standard IEEE 802.11, suitable for the unlicensed frequency bands of 2.4 GHz and 5 GHz (ISM bands)
- Reduced operating costs, because there is no wear of rotating and moving plant sections
- Cost-effective connection to devices which are remote, difficult to access or in hostile environments

■ Application

The Access Points of the SCALANCE W780 product line are designed for both industrial use and for demanding climatic requirements outdoors. Versions for the inexpensive integration in cabinets or in devices are also available. They offer a reliable radio connection, versatile redundancy mechanisms, and fast transfer of stations from one access point to the next (roaming). In this manner, processes can be monitored and production failures through machine downtimes avoided. In addition, Industrial Wireless LAN (IWLAN) can be used in time-critical applications associated with production automation (PROFINET IO) or for safety-related signals (PROFIsafe).

Due to the high degree of protection (IP65) and the extended temperature range from -40 °C to +70 °C, the Access Points are ideally suited for use in the outdoor area. SCALANCE W products are silicone-free and can therefore also be used in paint plants.

When using the RCoax cable (radiating cable), operation is particularly reliable in conveying technology and all track applications (e.g. storage and retrieval systems).

SCALANCE W786 versions are available with internal antennas for demanding environmental requirements.

8

Application (continued)

Application examples:

- Automated guided vehicles and suspended monorails; prevention of wear and high flexibility in the choice of route thanks to wireless transmission of data to the vehicles

- Crane; high flexibility through access to data communication with the moving unit independent of the location

- Mobile control console; reliable intervention in the process thanks to data communication over IWLAN with mobile units (e.g. Mobile Panel 277(F) IWLAN); the number of operator panels is therefore determined by the number of personnel and no longer by the number of control desks.

- Wireless access to field devices for configuration and testing

- Communication with moving stations (e.g. mobile controls and devices), container logistics, storage and retrieval machines, conveyor systems, conveyor belts, rotating machines, trucks

- Wireless coupling of communication segments and bridging of large distances for fast commissioning and for cost-effective networks in which cable routing would be extremely expensive (e.g. on public roads, rivers, lakes, train lines)

- Localization of personnel and machines using WLAN tags and localization software from AeroScout

Localization of personnel and machines via an IWLAN infrastructure

Design

- Wireless card (compatible with IEEE 802.11a/b/g/h) permanently installed in the device

- Designed without rotating parts (operation without fans)

- Antennas can either be connected by means of a screw connection (R-SMA) or integrated into a device (SCALANCE W786 only)

- Function LEDs for optical signaling of faults and operating states

- 1 x C-PLUG/PRESET-PLUG slot

Function

A simple wireless link can be constructed from a single access point (infrastructure mode). The access point provides an Industrial Ethernet interface for connection to the wireline network. Stations, such as mobile controllers or a Field PG can move freely within the wireless link and exchange data with other stations through this access point.

If the wireless link of a single access point (wireless cell) is insufficient, it can be expanded by further access points. The individual wireless cells must overlap so that moving stations can be passed seamlessly from one access point to the next (roaming). This is performed invisibly to the application. The access points must be able to exchange data via Industrial Ethernet or a Wireless Distribution System (WDS).

If the Access Points are not connected to Industrial Ethernet using a wired connection (e.g. no cable tray available for data line), the operating mode "Wireless Distribution System" must be selected. An Access Point from the SCALANCE W780 product line can communicate via WDS with up to eight other Access Points which are not connected to the data network by a direct wired connection. Directional additional antennas can be used to achieve ranges of several thousand meters outdoors.

Apart from a reliable radio link, the SCALANCE W780 Access Points are characterized by their support of IT mechanisms:

- IEEE 802.11a/b/g for different frequency ranges
- IEEE 802.11h for use in the 5 GHz range outdoors
- IEEE 802.11e for Wireless Multimedia (WMM)
- IEEE 802.11i for security
- Construction of redundant networks with the Rapid Spanning Tree Protocol (RSTP)
- Virtual networks (VLAN) to logically separate, for example, different user groups
- Sending the log entries of the SCALANCE W devices to a Syslog server
- Modern security mechanisms (e.g. network security such as IEEE 802.1x, RADIUS, EAP mechanisms)
- In client mode:
  Network and Port Address Translation (NAT/PAT):
  Mapping of private IP addresses and ports to public addresses

Security

A high degree of data security is achieved by means of the WPA2/IEEE 802.11i mechanisms. These define modern procedures that control a regular exchange of the complete 128-bit code as well as performing the access check (authentication) of a station. The Advanced Encryption Standard (AES) is available for data encryption.

Access to the devices (HTTPS) is encrypted and secure logon (SSH) is possible. If a security concept with Virtual Private Networks (VPN) or the SCALANCE S range is required, the products can be integrated without any difficulty.

iFeatures (only for RR versions of the access points)

iPCF (industrial Point Coordination Function)

The **iPCF** mode is recommendedfor applications with a requirement for real-time and predictable response times (deterministic response), even during roaming of moving stations from one access point to the next. This ensures that wireless PROFINET IO is supported and that safety-related signals, e.g. emergency stop, can be integrated into the wireless link. This means that even video signals from moving stations can be transmitted with a high level of quality.

The iPCF mechanism expands the IEEE 802.11 standard and must be available on both the station and the access point (e.g. SCALANCE W788-1RR). In a wireless link in which iPCF is used, no IEEE 802.11-compliant stations can be operated.

iPCF is recommended for applications where wireless network nodes move along predefined paths (e.g. suspended monorail). RCoax leaky wave cables or directional antennas must be used for this purpose.

Note:
The IWLAN/PB Link PN IO gateway also supports iPCF

8

Overview

■ **Function** (continued)

iPCF-MC (iPCF Management Channel)

iPCF-MC is available as further development of iPCF. This mode should be used if IWLAN stations that also support iPCF-MC (e.g. Client Modules SCALANCE W747-1RR, Mobile Panel 277F IWLAN) move freely about in the coverage area (especially when using omni-directional antennas) and are to exchange data deterministically. This functionality can only be implemented in combination with RR access point versions with at least two wireless interfaces.

Note:
Due to the lower bandwidth when using iPCF-MC, we recommend the iPCF mode for transmitting video signals.

Roaming of a mobile panel between two access points while maintaining error-free communication with iPCF-MC

Industrial Wireless Communication
IWLAN – Access Points IEEE 802.11a/b/g

Overview

■ Function (continued)

iHOP

With the supplementary function **iHOP**, the access point changes the channel in coordination with its clients. If it detects interferences which are caused, for example, by sporadically active WLANs on a channel, it avoids the affected channel temporarily. Hopping to the other channel is carried out so rapidly that usually the application is not impaired by the channel change. If the interferences occur throughout the complete frequency band, it is even possible to change to another frequency band (e.g. from 2.4 to 5 GHz).

This guarantees reliable communication even with interferences in the wireless field.

Note:
These iFeatures cannot be used in parallel.

Coordinated changing of channels by means of a channel hopping procedure (iHOP) to avoid disrupters

iHOP function for SCALANCE W access points

Diagnostics and management

- Web-based (HTTP/HTTPS) management tool for configuration and diagnostics using a standard browser
- Planning, configuration, simulation and measurement of the wireless link on site (Site Survey) with SINEMA E
- LEDs for signaling operating states and fault conditions
- Signaling of faults by means of SNMP trap or e-mail to a network management tool, e.g. SINEMA-Server

Industrial Wireless Communication
IWLAN – Access Points IEEE 802.11a/b/g

SCALANCE W784 for use in the control cabinet

Overview

- Especially suitable for applications where the access point is to be mounted in the control cabinet
- Low-cost alternative for use indoors with less severe environmental conditions
- The rugged aluminum enclosure with degree of protection IP30 nevertheless provides protection against mechanical and electromagnetic stress in industrial areas

Design

- Low-profile, compact aluminum enclosure, shock and vibration-proof for high mechanical requirements
- Dust protection with IP30 degree of protection
- For use at ambient temperatures from -20 °C to +60 °C
- Construction and design suitable for integration in a device or for installation in a cabinet
- 2 x R-SMA sockets for the connection of remote antennas
- 1 x RJ45 connection for 10/100 Mbit/s with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- 1 x 24 V DC connection for redundant power infeed
- 1 x C-PLUG slot
- Function LEDs for optical signaling of faults and operating states
- Mounting: Wall or, with optional mounting set, on S7 mounting rail, 35 mm standard mounting rail

Design and interfaces of the SCALANCE W784 access points

Product versions

SCALANCE W784-1

- A wireless card permanently installed in the device

SCALANCE W784-1RR

- A radio card permanently installed in the device for establishing wireless connections with iPCF

Industrial Wireless Communication
## IWLAN – Access Points IEEE 802.11a/b/g

SCALANCE W784 for use in the control cabinet

■ Function

SCALANCE W784 access points for control cabinet installation can also be operated as client modules. As an alternative, the SCALANCE W740 client modules can be used for this mode.

In combination with the SCALANCE W740 Client Modules with degree of protection IP30, an infrastructure can be set up in which great temperature differences and protection against dust and water play a somewhat less prominent role.

Implementing an automatic guided transport system in a wireless link with SCALANCE W784-1RR and RCoax cable.

The mobile automated guided vehicles are integrated in the IWLAN wireless field over the SCALANCE W747-1 Ethernet Client Modules. Both the Access Points and the Client Modules are in the control cabinet.

Industrial Wireless Communication
IWLAN – Access Points IEEE 802.11a/b/g

SCALANCE W788 for the indoor area

Overview

- Particularly suitable for industrial applications without control cabinets.

Design

- Rugged metal enclosure, shock and vibration-proof for high mechanical requirements in industrial applications designed without cabinets
- High IP65 degree of protection against dust and water jets
- For use at ambient temperatures from -20 °C to +60 °C
- Resistant to condensation
- 2 x R-SMA sockets for the connection of remote antennas (4 x R-SMA for the versions with two radio modules)
- 1 x hybrid socket for data and energy line for infeed over the IE FC Modular Outlet or for supplying with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- 1 x M12 socket for redundant power infeed (18 to 32 V DC, 48 V DC), e.g. in conjunction with the PS791-1PRO (90 to 265 V AC) power supply
- 1 x C-PLUG slot
- Function LEDs for optical signaling of faults and operating states
- Mounting: Wall, S7-300 mounting rail (90 mm length, vertically mounted, bolts included in scope of supply), or with optional mounting aid on 35 mm DIN rail

Design and interfaces of the SCALANCE W788 access points

Product versions

SCALANCE W788-1PRO

- A wireless card permanently installed in the device

SCALANCE W788-1RR

- A radio card permanently installed in the device for establishing wireless connections with iPCF

SCALANCE W788-2PRO

- Two wireless cards permanently installed in the device

SCALANCE W788-1RR

- Two wireless cards permanently installed in the device for establishing wireless connections with iPCF

■ Function

The devices can be installed at the location that is most favorable for the wireless field. The enclosures and the connectors resist high levels of shock and vibration loading because all the connections are screwed or latched. To achieve optimal illumination for special applications, the supplied antennas can be replaced.

SCALANCE W788 access points can also be operated as client modules. As an alternative, the SCALANCE W740 client modules can be used for this mode.

The devices with two interfaces have two separate wireless modules and behave like two separate devices in the wireless network. This feature can be used to implement cost-effective solutions, e.g. when a wireless interface is used for wireless connection of a distant production site and the second wireless interface provides a wireless field at the access point. Local stations can log in here and move around freely. Two separate wireless modules, however, also permit the setup of redundant wireless fields so that a high level of operational reliability can be achieved.

Roaming of moving units (e.g. Field PG and mobile controller) in a wireless network with two access points

Stations, e.g. a Field PG M, can move freely in the wireless field of the SCALANCE W788-1PRO access points for mobile HMI. In addition, SCALANCE W746-1PRO connects mobile HMI, controller and PC units wirelessly to the data network.

The IWLAN wireless coverage of SCALANCE W788-1PRO permits S7 communication and open communication between the devices on the AGVs and stationary S7-400, as well as on the stationary SIMATIC HMI device.

Provided that a delay (several 100 ms) caused by roaming in accordance with IEEE 802.11 is tolerated by all communication stations when switching the wireless cells, the communication continues uninterrupted.

If very fast update times are necessary, e.g. for PROFINET IO communication, access points and client modules that support the iPCF function for very fast roaming and deterministic data traffic are to be used, for example SCALANCE W788-1RR and W747-1RR.

When an extremely reliable wireless field is essential, it is recommended that the RCoax Cable is used as an alternative to conventional antennas. This leaky-wave cable is a special antenna along which a wireless field propagates and which is therefore suitable for applications in which, for example, nodes move along a rail but must have non-contact connection to the data network to prevent wear from collector wires.

Industrial Wireless Communication
IWLAN – Access Points IEEE 802.11a/b/g

SCALANCE W788 for the indoor area

■ **Function** (continued)

The Field PG accesses a wireless interface of SCALANCE W788-2RR for configuring, the other interface carries out communication with the RCoax cable using iPCF

The dual access point, SCALANCE W788-2RR, can provide two separate wireless fields. For example, a Field PG can use one wireless field for configuration. For clear separation of the applications an RCoax cable can be used to implement contactless PROFINET I/O data communication with the mobile suspension gear over an IWLAN/PB Link.

SCALANCE W788 access points

IWLAN access points with built-in wireless interfaces; wireless networks IEEE 802.11a/b/g/h at 2.4/5 GHz up to 54 Mbit/s; WPA2/AES; Power over Ethernet (PoE), IP65 degree of protection (-20°C to +60°C); scope of supply: two ANT795-4MR antennas, IP67 hybrid plug-in connector, mounting hardware, manual on CD-ROM, German/English

SCALANCE W788-1PRO

IWLAN Access Point with <u>one</u> built-in radio interface
- National approvals for operation outside the USA — 6GK5 788-1AA60-2AA0
- National approvals for operation within the USA[1] — 6GK5 788-1AA60-2AB0

SCALANCE W788-2PRO

IWLAN Dual Access Point with <u>two</u> built-in radio interfaces
- National approvals for operation outside the USA — 6GK5 788-2AA60-2AA0
- National approvals for operation within the USA[1] — 6GK5 788-2AA60-2AB0

SCALANCE W788-1RR

IWLAN Access Point with <u>one</u> built-in radio interface for establishment of radio links with iPCF
- National approvals for operation outside the USA — 6GK5 788-1AA60-6AA0
- National approvals for operation within the USA[1] — 6GK5 788-1AA60-6AB0

SCALANCE W788-2RR

IWLAN Dual Access Point with <u>two</u> built-in radio interfaces for establishment of radio links with iPCF
- National approvals for operation outside the USA — 6GK5 788-2AA60-6AA0
- National approvals for operation within the USA[1] — 6GK5 788-2AA60-6AB0

[1] Please note national approvals at www.siemens.com/wireless-approvals

Accessories

C-PLUG

Swap medium for simple replacement of devices in the event of a fault; for storing configuration data; can be used in SIMATIC NET products with PLUG slot — 6GK1 900-0AB00

PRESET-PLUG — 6GK5 798-8AB00

Swap medium for simple initial startup of SCALANCE W access points and client modules, as well as IWLAN/PB Link PN IO

SIMATIC Mobile Panel 277F IWLAN
- Communication via WLAN (PROFINET) with acknowledgement button and emergency stop button — 6AV6 645-0DB01-0AX0
- Communication via WLAN (PROFINET) with acknowledgment button and emergency stop button with integrated handwheel, key-operated switch, and two illuminated pushbuttons — 6AV6 645-0DC01-0AX0

Note:
Please also order the desktop power supply or battery charger!
- Table-top power supply incl. power cable for EU, US, UK, JP (only suitable for operation under laboratory/office conditions) — 6AV6 671-5CN00-0AX1
- Charger for safe storage and charging the device incl. lock for securing the device in the charger. Charging capabilities for up to two additional batteries — 6AV6 671-5CE00-0AX0
- Additional battery with LED indicator for indicating the charge status — 6AV6 671-5CL00-0AX0
- Transponder incl. batteries (3x AA) — 6AV6 671-5CM00-0AX0

SCALANCE W786 for the outdoor area

Overview

- Especially well suited to applications with high climatic requirements when installed outdoors and in areas accessible to the public

Design

- Rugged plastic enclosure (plexi-glass type), shock and vibration-proof for severe mechanical loading
- High IP65 degree of protection against dust and water jets
- For use at ambient temperatures from -40 °C to +70 °C
- Resistant to condensation
- Resistant to UV radiation and saltwater spray
- Up to 6 x R-SMA sockets for the connection of remote antennas
- Version with 1 x RJ45 connection for 10/100 Mbit/s with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- Version with 1 x BFOC connection for 10/100 Mbit/s multimode FOC
- 1 x 48 V DC connection (also redundant power infeed), optional operation on 12 … 24 V DC or 100 … 240 V AC with power supply integrated into device
- 1 x C-PLUG slot
- Function LEDs for optical signaling of faults and operating states
- Mounting: Wall or, with optional mounting set, on S7 mounting rail, 35 mm standard mounting rail, or on a pole

Design and interfaces of the SCALANCE W786 access points

Product versions

SCALANCE W786-1PRO

- A wireless card permanently installed in the device
- Versions with:
  - RJ45 connection and two internal antennas
  - RJ45 connection and two connections for external antennas
  - Fiber-optic connection and two internal antennas
  - Fiber-optic connection and two connections for external antennas

SCALANCE W786-2PRO

- Two wireless cards permanently installed in the device
- Versions with:
  - RJ45 connection and four internal antennas
  - RJ45 connection and four connections for external antennas
  - Fiber-optic connection and four internal antennas
  - Fiber-optic connection and four connections for external antennas

SCALANCE W786-3PRO

- Three wireless cards permanently installed in the device
- Versions with:
  - RJ45 connection and six connections for external antennas
  - Fiber-optic connection and six connections for external antennas

SCALANCE W786-2RR

- Two wireless cards permanently installed in the device; for establishing wireless connections with iPCF
- Versions with:
  - RJ45 connection and four internal antennas
  - RJ45 connection and four connections for external antennas

Industrial Wireless Communication
IWLAN – Access Points IEEE 802.11a/b/g

SCALANCE W786 for the outdoor area

Function

Where access points with three wireless modules
(e.g. W786-3PRO) are used, communication between the
access points is implemented with two modules each.
The wireless field for the station, e.g. an automated guided
vehicle, is established by the third wireless module. This means
that larger directional radio paths can be established and
communication with the stations is also possible.

Programming of robots in the safety-related environment

In this configuration three effective ranges are defined, in which
robots can be programmed using the Mobile Panel 277(F)
IWLAN (teaching). If a fault occurs during the programming,
e.g. on leaving the safety-related areas or in the case of
unforeseen incidents, the plant is brought to the safe state with
the aid of the integrated emergency-stop procedure using the
IWLAN structure implemented with SCALANCE W786-2RR.
The safety of the entire plant is achieved by means of PROFINET
with the PROFIsafe protocol which is implemented not only
on the PROFINET controller (CPU 317F-2 PN/DP), but also on
the PROFINET device (Mobile Panel 277(F) IWLAN). The
SCALANCE W786-2RR that has the iPCF mechanism ensures
that the response times necessary for the functional safety are
adhered to.

Function (continued)

If the minimum length of standard Ethernet cables is insufficient due to the large distance of the access points from the wired network, SCALANCE W786 can also be used in a version with BFOC connectors (multimode fiber-optic cable).

Use of the SCALANCE W786 product line in sectors subject to high climatic requirements

In the case of SCALANCE W786, this only concerns access points which can, however, be configured as client modules through Web-based management. Then, depending on the selected version, a maximum of one wireless module will be available as a client.

Industrial Wireless Communication
IWLAN – Access Points IEEE 802.11a/b/g

SCALANCE W786 for the outdoor area

Ordering data	Order No.		Order No.

SCALANCE W786 access points

IWLAN access points with built-in wireless interfaces; wireless networks IEEE 802.11a/b/g/h at 2.4/5 GHz up to 54 Mbit/s; WPA2/AES; Power over Ethernet (PoE), IP65 degree of protection (-40 °C to +70 °C); scope of supply: Mounting hardware, 2-pin screw terminal for 48 V DC; manual on CD-ROM; German/English;

SCALANCE W786-1PRO

IWLAN Access Points with one built-in radio interface

RJ45 connection

- Two internal antennas
  - National approvals for operation outside the USA — 6GK5 786-1BA60-2AA0
  - National approvals for operation within the USA[1] — 6GK5 786-1BA60-2AB0
- Connections for two external antennas
  - National approvals for operation outside the USA — 6GK5 786-1AA60-2AA0
  - National approvals for operation within the USA[1] — 6GK5 786-1AA60-2AB0

Fiber-optic cable connection

- Two internal antennas
  - National approvals for operation outside the USA — 6GK5 786-1BB60-2AA0
  - National approvals for operation within the USA[1] — 6GK5 786-1BB60-2AB0
- Connections for two external antennas
  - National approvals for operation outside the USA — 6GK5 786-1AB60-2AA0
  - National approvals for operation within the USA[1] — 6GK5 786-1AB60-2AB0

SCALANCE W786 access points (continued)

SCALANCE W786-2PRO

IWLAN Access Points with two built-in radio interfaces

RJ45 connection

- Four internal antennas
  - National approvals for operation outside the USA — 6GK5 786-2BA60-2AA0
  - National approvals for operation within the USA[1] — 6GK5 786-2BA60-2AB0
- Connections for four external antennas
  - National approvals for operation outside the USA — 6GK5 786-2AA60-2AA0
  - National approvals for operation within the USA[1] — 6GK5 786-2AA60-2AB0

Fiber-optic cable connection

- Four internal antennas
  - National approvals for operation outside the USA — 6GK5 786-2BB60-2AA0
  - National approvals for operation within the USA[1] — 6GK5 786-2BB60-2AB0
- Connections for four external antennas
  - National approvals for operation outside the USA — 6GK5 786-2AB60-2AA0
  - National approvals for operation within the USA[1] — 6GK5 786-2AB60-2AB0

SCALANCE W786-3PRO

IWLAN Access Points with three built-in radio interfaces

RJ45 connection

- Connections for six external antennas
  - National approvals for operation outside the USA — 6GK5 786-3AA60-2AA0
  - National approvals for operation within the USA[1] — 6GK5 786-3AA60-2AB0

Fiber-optic cable connection

- Connections for six external antennas
  - National approvals for operation outside the USA — 6GK5 786-3AB60-2AA0
  - National approvals for operation within the USA[1] — 6GK5 786-3AB60-2AB0

SCALANCE W786-2RR

IWLAN Dual Access Point with two built-in radio interfaces for establishment of radio links with iPCF

RJ45 connection

- Four internal antennas
  - National approvals for operation outside the USA — 6GK5 786-2BA60-6AA0
  - National approvals for operation within the USA[1] — 6GK5 786-2BA60-6AB0
- Connections for four external antennas
  - National approvals for operation outside the USA — 6GK5 786-2AA60-6AA0

Industrial Wireless Communication
IWLAN – Controller Access Points IEEE 802.11a/b/g

**Controller Access Points SCALANCE W786
for the outdoor area**

Overview

- SCALANCE W786-2HPW controller-based access points can only be operated on the SCALANCE WLC IWLAN Controller and Enterasys Wireless Controller (previously HiPath Wireless Controller)
- Support for the WLAN standards IEEE 802.11a/b/g/h
- Especially well suited to applications with high climatic requirements when installed outdoors and in areas accessible to the public

Design

- Rugged plastic enclosure (plexi-glass type), shock and vibration-proof for severe mechanical loading
- High IP65 degree of protection against dust and water jets
- For use at ambient temperatures from -40 °C to +70 °C
- Resistant to condensation
- Resistant to UV radiation and saltwater spray
- Design for use outdoors
- Version with 1 x RJ45 connection for 10/100 Mbit/s with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- Version with 1 x fiber-optic connection (multimode) for 100 Mbit/s
- Version with 1 x 48 V DC connection, optional operation with 12 to 24 V DC or 100 to 240 V AC with power supply integrated into device
- Mounting: Wall or, with optional mounting set, on S7 mounting rail, 35 mm standard mounting rail, or on a pole

Design and interfaces of the SCALANCE W786-2HPW controller-based access points

Product versions

SCALANCE W786-2HPW (controller-based)

- Two wireless cards permanently installed in the device
- Versions with:
  - RJ45 connection and four internal antennas
  - RJ45 connection and four connections for external antennas
  - Fiber-optic multimode connection (BFOC) and four internal antennas
  - Fiber-optic multimode connection (BFOC) and four connections for external antennas

Function

If the minimum length of standard Ethernet cables is insufficient due to the large distance of the access points from the wired network, SCALANCE W786-2HPW can also be used in a version with BFOC connectors (multimode fiber-optic cable).

Overview

The Client Modules from the SCALANCE W748 product line are optimal for integrating Industrial Ethernet stations into Industrial Wireless LAN (IWLAN) for 2.4 GHz and 5 GHz.

- High transmission rates (up to 450 Mbit/s in conjunction with Channel Bonding) due to 3x3 MIMO technology (**M**ultiple **I**nput, **M**ultiple **O**utput); for this purpose, SCALANCE W Client Modules use three streams each for simultaneous sending and receiving
- Suitable for any application:
  - SCALANCE W748 RJ45 for installation in a control cabinet
  - SCALANCE W748 M12 for cabinet-free installation
- Reliable thanks to rugged enclosure, protected from water and dust (IP65), resistant to shock, vibration and electromagnetic fields
- Complex applications with redundancy requirements and high bandwidths, e.g. for video, by using IEEE 802.11n
- Configuration support by means of wizards and online help; easy management via web server and SNMP
- Fast replacement of devices in event of failure by means of optional C-PLUG (Configuration Plug)

Benefits

get Designed for Industry

- Reliable radio link, e.g. by using MIMO technology and monitoring of the radio link
- Cost savings due to one single radio network both for process-critical data and for non-critical communication
- Investment security because all products are compatible with the internationally recognized WLAN standard IEEE 802.11, suitable for the unlicensed frequency bands of 2.4 GHz and 5 GHz (ISM bands)
- Implementation of data-intensive applications such as video streaming through the support of the IEEE 802.11n standard including Channel Bonding
- Reduced operating costs, because there is no wear of rotating and moving plant sections
- Cost-effective connection to devices which are remote, difficult to access or mounted in hostile environments

Application

The Client Modules of the SCALANCE W748 product line are designed for indoor and outdoor industrial applications as well as for low-cost integration in control cabinets. They provide a reliable wireless link with fast transfer from one access point to the next (roaming). In this manner, processes can be monitored and production failures through machine downtimes avoided.

The client modules with high IP65 degree of protection and extended temperature range from -20 to +60 °C are especially suitable for use outdoors. SCALANCE W products are silicone-free and can therefore also be used in paint shops.

The client modules with IP30 degree of protection are especially suitable for use in automated guided vehicle systems or suspended monorails.

When using the RCoax cable (radiating cable), operation is particularly reliable in conveying technology and all track applications (e.g. storage and retrieval systems).

8

Industrial Wireless Communication
IWLAN – Client Modules IEEE 802.11n

Overview

Application (continued)

Application examples:

- Automated guided vehicle systems (AGVS) and suspended monorails;
  prevention of wear and high flexibility in the choice of route thanks to wireless transmission of data to the vehicles
- Crane;
  high flexibility through access to data communication with the moving unit independent of the location
- Passenger transportation systems;
  transmission of high-quality video streams between the control center and buses or trains

- Tunnel application;
  reliable radio link since the devices can handle multiple path propagation better by using the MIMO technology
- Communication with moving stations (e.g. mobile controls and devices), container logistics, storage and retrieval machines, conveyor systems, conveyor belts, rotating machines, trucks
- Wireless coupling of communication segments and bridging of large distances for fast commissioning and for cost-effective networks in which cable routing would be extremely expensive (e.g. on public roads, rivers, lakes, train lines)

Multiple path propagation (MIMO) with SCALANCE W788-1PRO and SCALANCE W788-1 M12

Design

- Radio card (compatible with IEEE 802.11a/b/g/h/n) permanently installed in the device
- Designed without rotating parts (operation without fans)
- Antennas can either be connected by means of a screw connection (R-SMA, N-Connect) or they are integrated in the device
- Function LEDs for optical signaling of faults and operating states
- 1x PLUG slot

8

■ Function

Infrastructure mode

SCALANCE W748 Client Modules make it possible for a station with an Industrial Ethernet interface (e.g. a controller) to move seamlessly and with no wear in an Industrial Wireless LAN wireless field. The station registers in the wireless field via the Client Module and can exchange information with the entire data network. If the Client Module moves, for example, on an automated guided vehicle system, it is automatically and transparently transferred from one access point to the next (roaming).

This is possible over distances of up to 30 m indoors (approx. 100 m outdoors). Directional additional antennas can be used outdoors to achieve ranges of several thousand meters.

Apart from a reliable wireless link, the SCALANCE W748 Client Modules are characterized by their support of IT mechanisms:

- IEEE 802.11a/b/g/n for different frequency ranges
- IEEE 802.11h for use in the 5 GHz range outdoors
- IEEE802.11e for wireless multimedia (WMM)
- IEEE802.11i for security
- Selectable operation in infrastructure or ad-hoc mode
- Sending the log entries of the SCALANCE W devices to a Syslog server
- Modern security mechanisms (e.g. network security such as IEEE 802.1x, RADIUS, EAP mechanisms)
- Network and Port Address Translation (NAT/PAT) for mapping of private IP addresses and ports onto public addresses

Security

A high degree of data security is achieved by means of the WPA2/IEEE 802.11i mechanisms. These define modern procedures that control a regular exchange of the complete 128-bit code as well as performing the access check (authentication) of a station. The Advanced Encryption Standard (AES) is available for data encryption.

Access to the devices (HTTPS) is encrypted and secure logon (SSH) is possible. If a security concept with Virtual Private Networks (VPN) or the SCALANCE S range is required, the products can be integrated without any difficulty.

Functional scope

The SCALANCE W748 Client Modules can manage the wireless connection for up to eight connected devices with Ethernet interface. It is possible to integrate mobile units with a small Ethernet network (up to eight devices) into an IWLAN wireless field.

Diagnostics and management

- Web-based (HTTP/HTTPS) management tool for configuration and diagnostics using a standard browser
- LEDs for signaling operating states and fault conditions
- Signaling of faults by means of SNMP trap or e-mail to a network management tool, e.g. SINEMA-Server

8

Industrial Wireless Communication

IWLAN — Client Modules IEEE 802.11n

SCALANCE W748 RJ45
for use in the control cabinet

◼ Overview

- Especially suitable for applications where the client module is to be mounted in the control cabinet
- Low-cost alternative for use indoors with less severe environmental conditions
- The rugged aluminum enclosure with degree of protection IP30 nevertheless provides protection against mechanical and electromagnetic stress in industrial areas

◼ Design

- Rugged aluminum enclosure, shock and vibration-proof, for high mechanical requirements
- Dust protection with IP30 degree of protection
- For use at ambient temperatures from -20 °C to +60 °C
- Resistant to condensation
- Design suitable for installation in control cabinet
- 3 x R-SMA sockets for the connection of remote antennas
- Antenna placement optimized for the 3x3 MIMO technology; the antennas do not interfere with each other when they are mounted direct on the device
- 1 x RJ45 connection for 10/100/1000 Mbit/s with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- 2 x 24 V DC connection for redundant power infeed
- 1 x PLUG slot
- Function LEDs for optical signaling of faults and operating states
- Digital input for feeding in a signal from a sensor, for example, to an SNMP-based network management system
- Digital output for converting a command received over SNMP into a signal and switching a hardware function
- Mounting: Wall, S7 mounting rail or on 35 mm standard mounting rail

Design and interfaces of the SCALANCE W748-1 RJ45 Client Modules

Product versions

SCALANCE W748-1 RJ45

- A wireless card permanently installed in the device; for managing the wireless connection of up to eight connected devices

Industrial Wireless Communication
IWLAN – Client Modules IEEE 802.11n

SCALANCE W748 M12 for use in the indoor area

■ **Overview**

- Particularly suitable for industrial applications without control cabinets

■ **Application**

Mobile controls in an automated guided vehicle system

The controllers register via the Ethernet Client Modules W748-1 M12 in the wireless field and can move around freely there. This makes it possible to operate an automated guided vehicle system, for example.

Industrial Wireless Communication
IWLAN – Client Modules IEEE 802.11n

SCALANCE W748 M12 for use in the indoor area

■ **Design**

- Rugged aluminum enclosure, shock and vibration-proof, for high mechanical requirements
- High IP65 degree of protection against dust and water jets
- For use at ambient temperatures from -20 °C to +60 °C
- Resistant to condensation
- 3 x N-Connect sockets for the connection of remote antennas
- Antenna placement optimized for the 3x3 MIMO technology; the antennas do not interfere with each other when they are mounted direct on the device
- 1 x M125 connection for 10/100/1000 Mbit/s with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- 1 x M12 socket for energy supply (24 V DC)
- 1 x PLUG slot
- Function LEDs for optical signaling of faults and operating states
- Mounting: Wall, S7 mounting rail or on 35 mm standard mounting rail

3x N-Connect (female) connections for antennas

Design and interfaces of the SCALANCE W748-1 M12 Client Modules

Overview

The Ethernet Client Modules from the SCALANCE W740 product line are optimal for integrating Industrial Ethernet stations into Industrial Wireless LANs (IWLANs) for 2.4 GHz and 5 GHz with transmission rates of up to 54 Mbit/s.

- Suitable for any application:
  - SCALANCE W74x-1 for installation in a cabinet or integration in devices
  - SCALANCE W74x-1PRO for cabinet-free installation
- Reliable thanks to rugged housing, protected from water and dust (IP65), resistant to shock, vibration and electromagnetic fields
- Approved for operation in hazardous areas in Zone 2
- Demanding applications with real-time and redundancy requirements, such as PROFINET with PROFIsafe
- In conformance with standards, as it supports IEEE 802.11; additional functional expansions with software functions, especially for applications demanding high reliability, e.g. channel hopping procedure (iHOP), cyclic real-time data traffic, and very high-speed roaming (iPCF)
- The SINEMA E engineering tool, wizards and online help support planning, simulation, configuration, site survey and documentation; easy management with the web server and SNMP
- Quick commissioning of Client Modules with the optional swap medium PRESET-PLUG and quick device exchange in case of faults with the optional swap medium C-PLUG (Configuration Plug)

Benefits

get Designed for Industry

- Predictable data traffic (strict real-time requirements) and defined response times on the wireless link
- Reliable wireless link, e.g. due to redundant connection and cyclic monitoring of the wireless path
- Cost savings due to one single radio network both for process-critical data and for non-critical communication
- Investment security because all products are compatible with the internationally recognized WLAN standard IEEE 802.11, suitable for the unlicensed frequency bands of 2.4 GHz and 5 GHz (ISM bands)
- Reduced operating costs, because there is no wear of rotating and moving plant sections
- Cost-effective connection to devices which are remote, difficult to access or in hostile environments

Application

The Client Modules of the SCALANCE W740 product line are designed for indoor and outdoor industrial applications as well as for low-cost integration in control cabinets. They provide a reliable radio link, which will transfer quickly from one Access Point to the next (roaming). In this manner, processes can be monitored and production failures through machine downtimes avoided. In addition, Industrial Wireless LAN (IWLAN) can be used in time-critical applications associated with production automation (PROFINET IO) or for safety-related signals (PROFIsafe).

The client modules with high IP65 degree of protection and extended temperature range from -20 to +60 °C are especially suitable for use outdoors. SCALANCE W products are silicone-free and can therefore also be used in paint shops.

The client modules with IP30 degree of protection are especially suitable for use in automated guided vehicle systems or suspended monorails.

When using the RCoax cable (radiating cable), operation is particularly reliable in conveying technology and all track applications (e.g. storage and retrieval systems).

Application examples:

- Automated guided vehicle systems (AGVS) and suspended monorails;
  prevention of wear and high flexibility in the choice of route thanks to wireless transmission of data to the vehicles
- Cranes;
  high flexibility through access to data communication with the moving unit independent of the location
- Communication with moving stations (e.g. mobile controls and devices), container logistics, storage and retrieval machines, conveyor systems, conveyor belts, rotating machines, trucks
- Wireless coupling of communication segments and bridging of large distances for fast commissioning and for cost-effective networks in which cable routing would be extremely expensive (e.g. on public roads, rivers, lakes, train lines)

8

Industrial Wireless Communication
IWLAN – Client Modules IEEE 802.11a/b/g

Overview

Design

- Wireless card (compatible with IEEE 802.11a/b/g/h) permanently installed in the device
- Designed without rotating parts (e.g. operation without fans)
- Antennas can be connected via screw-type connection (R-SMA)
- Function LEDs for optical signaling of faults and operating states
- 1 x C-PLUG-/PRESET-PLUG slot

Function

Infrastructure mode

SCALANCE W740 Client Modules make it possible for a station with an Industrial Ethernet interface (e.g. a controller) to move seamlessly and with no wear in an Industrial Wireless LAN wireless field. The station registers in the wireless field via the Ethernet Client Module and can exchange information with the entire data network. If the Ethernet Client Module moves, for example, on an automated guided vehicle system, it is automatically and transparently transferred from one access point to the next (roaming).

This is possible over distances of up to 30 m indoors (approx. 100 m outdoors). Directional additional antennas can be used outdoors to achieve ranges of several thousand meters.

Apart from a reliable wireless connection, the SCALANCE W740 Client Modules are characterized by excellent support from IT mechanisms:

- IEEE 802.11 a/b/g for different frequency ranges
- IEEE 802.11h for use in the 5 GHz frequency range outdoors
- IEEE802.11e für multimedia, wireless multimedia (WMM)
- IEEE802.11i for security

- Selectable operation of infrastructure- and Ad-Hoc modes
- Sending the log entries of the SCALANCE W devices to a Syslog server
- Modern security mechanisms (e.g. network security such as IEEE 802.1x, RADIUS, EAP mechanisms)
- Network and Port Address Translation (NAT/PAT) (mapping of private IP addresses and ports onto public addresses)

Security

A high degree of data security is achieved by means of the WPA2/IEEE 802.11i mechanisms. These define modern procedures that control a regular exchange of the complete 128-bit code as well as performing the access check (authentication) of a station. The Advanced Encryption Standard (AES) is available for data encryption. All encryption mechanisms are integrated in the products and do not incur any additional costs.

Access to the devices (HTTPS) is encrypted and secure logon (SSH) is possible. If a security concept with Virtual Private Networks (VPN) or the SCALANCE S range is required, the products can be integrated without any difficulty.

Functional scope

SCALANCE W744-1PRO and SCALANCE W744-1 can administer one single IP address, namely that of the connected device. They establish a wireless connection precisely from this mobile device to the wireless network. If the connected device is replaced, the Ethernet Client Module recognizes this automatically, and registers the new address. This reduces plant downtimes and sources of error.

The SCALANCE W746-1PRO and SCALANCE W746-1 Ethernet Client Modules can administer the wireless connection for up to eight devices with an Ethernet interface. It is possible to integrate mobile units with a small Ethernet network (up to eight devices) into an IWLAN wireless field.

Assignment of an IP address via DHCP by a central DHCP server
Assignment of an IP address by an DHCP server in the IWLAN client module

Assignment of dynamic IP addresses to wirelessly connected stations by a central DHCP server or integrated DHCP server of an IWLAN client module

▌**Function** (continued)

iFeatures (only for SCALANCE W747-1RR and W747-1)

iPCF (industrial Point Coordination Function)

The **iPCF** mode is recommended for applications with a requirement for real-time and predictable response times (deterministic response), even during roaming of moving stations from one access point to the next. This ensures that wireless PROFINET IO is supported and that safety-related signals, e.g. emergency stop, can be integrated into the wireless link. This means that even video signals from moving stations can be transmitted with a high level of quality.

The iPCF mechanism expands the IEEE 802.11 standard and must be available on both the station and the access point (e.g. SCALANCE W788-1RR). In a wireless field in which iPCF is used, no IEEE 802.11-compliant stations can be operated.

iPCF is recommended for applications where wireless network nodes move along predefined paths (e.g. suspended monorail). RCoax leaky wave cables or directional antennas must be used for this purpose.

Note:
The IWLAN/PB Link PN IO gateway also supports iPCF

iPCF-MC (iPCF Management Channel)

iPCF-MC is available as further development of iPCF. This mode should be used if IWLAN stations that also support iPCF-MC (e.g. Client Modules SCALANCE W747-1RR, Mobile Panel 277F IWLAN) move freely about in the coverage area (especially when using omni-directional antennas) and are to exchange data deterministically. This functionality can only be implemented in combination with RR Access Point versions with at least two radio interfaces.

Note:
Due to the lower bandwidth when using iPCF-MC, we recommend the iPCF mode for transmitting video signals.

Roaming of a mobile panel between two access points while maintaining error-free communication with iPCF-MC

Industrial Wireless Communication
IWLAN – Client Modules IEEE 802.11a/b/g

Overview

Function (continued)

iHOP

With the supplementary function **iHOP**, the Access Point changes the channel in coordination with its clients. If it detects interferences which are caused, for example, by sporadically active WLANs on a channel, it avoids the affected channel temporarily. Hopping to the other channel is carried out so rapidly that usually the application is not impaired by the channel change. If the interferences occur throughout the complete frequency band, it is even possible to change to another frequency band (e.g. from 2.4 to 5 GHz). This guarantees reliable communication even with interferences in the wireless field.

Coordinated changing of channels by means of a channel hopping procedure (iHOP) to avoid disrupters

iHOP function for SCALANCE W Client Modules

Function (continued)

Dual Client

This function permits coupling of two Client Modules via an Industrial Ethernet Switch (e.g. SCALANCE X-200). One client is actively connected to an Access Point via IWLAN. The other client is in standby mode and continuously searches for an Access Point with better signal strength. If it finds one, its status changes to active and the previously active client switches to standby mode. Changeover between the clients is implemented without interrupting communication (seamless roaming).

Two linked IWLAN client modules form a dual client to enable uninterrupted roaming, e.g. for fast moving vehicles

Note:
These iFeatures cannot be used in parallel.

Diagnostics and management

- Web-based (HTTP/HTTPS) management tool for configuration and diagnostics using a standard browser
- Planning, configuration, simulation and measurement of the wireless field on site (Site Survey) with SINEMA E
- LEDs for signaling operating states and fault conditions
- Signaling of faults by means of SNMP trap or e-mail to a network management tool, e.g. SINEMA-Server

8

Industrial Wireless Communication
IWLAN – Client Modules IEEE 802.11a/b/g

■ Overview

- Especially suitable for applications where the client module is to be mounted in the control cabinet
- Low-cost alternative for use indoors with less severe environmental conditions
- The rugged aluminum enclosure with degree of protection IP30 nevertheless provides protection against mechanical and electromagnetic stress in industrial areas

■ Application

Use of the Ethernet Client Modules in a suspended monorail

The mobile units of a suspended monorail, for example, are linked to the IWLAN radio link via the Ethernet Client Modules SCALANCE W747-1. This is implemented by means of the SCALANCE W788-2RR Access Points and the RCoax cable. The Ethernet Client Modules are mounted in cabinets because of their mechanical characteristics.

SCALANCE W740 for use in the control cabinet

■ Design

- Low-profile, compact aluminum enclosure, shock and vibration-proof for high mechanical requirements
- Dust protection with IP30 degree of protection
- For use at ambient temperatures from -20 °C to +60 °C
- Construction and design suitable for integration in a device or for installation in a cabinet
- 2 x R-SMA sockets for the connection of remote antennas
- 1 x RJ45 connection for 10/100 Mbit/s with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- 1 x 24 V DC connection for redundant power infeed
- 1 x C-PLUG slot
- Function LEDs for optical signaling of faults and operating states
- Mounting: Wall or, with optional mounting set, on S7 mounting rail, 35 mm standard mounting rail

Configuration and interfaces for Client Modules
SCALANCE W744-1, W746-1, W747-1

Product versions

SCALANCE W744-1

- A wireless card permanently installed in the device; for managing the wireless connection of a connected device

SCALANCE W746-1

- A wireless card permanently installed in the device for managing the wireless connection of up to eight connected devices

SCALANCE W747-1

- A wireless card permanently installed in the device for managing the wireless connection with iPCF of up to eight connected devices

Industrial Wireless Communication
IWLAN – Client Modules IEEE 802.11a/b/g

SCALANCE W740 for use in the indoor area

■ Overview

• Particularly suitable for industrial applications without control cabinets.

■ Application

Mobile controls in an automated guided vehicle system

The controllers register via the Ethernet Client Modules
W746-1PRO in the radio link and can move around freely there.
This makes it possible to operate an automated guided vehicle
system, for example.

■ **Design**

- Rugged metal enclosure, shock and vibration-proof for high mechanical requirements in industrial applications designed without cabinets
- High IP65 degree of protection against dust and water jets
- For use at ambient temperatures from -20 °C to +60 °C
- Resistant to condensation
- 2 x R-SMA sockets for the connection of remote antennas (4 x R-SMA for the versions with two radio modules)
- 1 x hybrid socket for data and energy line for infeed over the IE FC Modular Outlet or for supplying with Power-over-Ethernet according to IEEE 802.3at Type 1 (corresponds to IEEE 802.3af)
- 1 x M12 socket for redundant power infeed (18 to 32 V DC, 48 V DC), e.g. in conjunction with the PS791-1PRO (90 to 265 V AC) power supply
- 1 x C-PLUG slot
- Function LEDs for optical signaling of faults and operating states
- Mounting: Wall, S7-300 mounting rail (90 mm length, vertically mounted, bolts included in scope of supply), or with optional mounting aid on 35 mm DIN rail

Product versions

SCALANCE W744-1PRO

- A wireless card permanently installed in the device; for managing the wireless connection of a connected device

SCALANCE W746-1PRO

- A wireless card permanently installed in the device; for managing the wireless connection of up to eight connected devices

SCALANCE W747-1RR

- For establishing wireless connections with iPCF; a wireless card permanently installed in the device; for managing the wireless connection of up to eight connected devices

Configuration and interfaces for Client Modules SCALANCE W744-1PRO, W746-1PRO, W747-1RR

Industrial Wireless Communication
IWLAN – Client Modules IEEE 802.11a/b/g

SCALANCE W740 for use in the indoor area

Ordering data	Order No.		Order No.
SCALANCE W740 Client Modules		*Accessories*	

IWLAN Ethernet Client Modules with built-in radio interface; radio networks IEEE 802.11a/b/g/h at 2.4/5 GHz to 54 Mbit/s; WPA/AES; Power over Ethernet (PoE), mounting hardware; 4-pin screw terminal for 24 V DC; manual on CD-ROM, German/English

SCALANCE W744-1PRO

For administration of the radio link of one device with Industrial Ethernet connection; IP65 degree of protection; scope of delivery: 2 antennas ANT795-4MR, IP 67 hybrid plug connector
- National approvals for operation outside the USA — **6GK5 744-1AA60-2AA0**
- National approvals for operation within the USA [1] — **6GK5 744-1AA60-2AB0**

SCALANCE W746-1PRO

For administration of the radio link of up to eight devices with Industrial Ethernet connection; IP65 degree of protection; scope of delivery: 2 antennas ANT795-4MR, IP 67 hybrid plug connector
- National approvals for operation outside the USA — **6GK5 746-1AA60-4AA0**
- National approvals for operation within the USA [1] — **6GK5 746-1AA60-4AB0**

SCALANCE W747-1RR

For administration of the radio link with iPCF of up to eight devices with Industrial Ethernet connection; IP65 degree of protection; scope of delivery: 2 antennas ANT795-4MR, IP 67 hybrid plug connector
- National approvals for operation outside the USA — **6GK5 747-1AA60-6AA0**
- National approvals for operation within the USA [1] — **6GK5 747-1AA60-6AB0**

C-PLUG — **6GK1 900-0AB00**

Swap medium for simple replacement of devices in the event of a fault; for storing configuration data; can be used in SIMATIC NET products with PLUG slot

PRESET-PLUG — **6GK5 798-8AB00**

Swap medium for simple initial startup of SCALANCE W access points and client modules, as well as IWLAN/PB Link PN IO

SIMATIC Mobile Panel 277F IWLAN
- Communication via WLAN (PROFINET) with acknowledgement button and emergency stop button — **6AV6 645-0DB01-0AX0**
- Communication via WLAN (PROFINET) with acknowledgment button and emergency stop button with integrated handwheel, key-operated switch, and two illuminated pushbuttons — **6AV6 645-0DC01-0AX0**

Note:
Please also order the desktop power supply or battery charger!
- Table-top power supply incl. power cable for EU, US, UK, JP (only suitable for operation under laboratory/office conditions) — **6AV6 671-5CN00-0AX1**
- Charger for safe storage and charging the device incl. lock for securing the device in the charger. Charging capabilities for up to two additional batteries — **6AV6 671-5CE00-0AX0**
- Additional battery with LED indicator for indicating the charge status — **6AV6 671-5CL00-0AX0**
- Transponder incl. batteries (3x AA) — **6AV6 671-5CM00-0AX0**

IE FC RJ45 modular outlet with power insert — **6GK1 901-1BE00-0AA3**

FastConnect RJ45 modular outlet for Industrial Ethernet with a replaceable insert for 1 x 24 V and 1 x 100 Mbit/s interface

IE Hybrid Cable 2x2 + 4x0.34 — **6XV1 870-2J**

4-wire, shielded installation cable; sold by the meter, up to 1000 m, minimum order 20 m

IE FC RJ45 Plug 180 2x2

RJ45 plug connector for Industrial Ethernet with a rugged metal enclosure and integrated insulation-displacement contacts for connecting Industrial Ethernet FC installation cables; with a 180° cable outlet; for network components and CPs/CPUs with Industrial Ethernet interface
- 1 pack = 1 unit — **6GK1 901-1BB10-2AA0**
- 1 pack = 10 units — **6GK1 901-1BB10-2AB0**
- 1 pack = 50 units — **6GK1 901-1BB10-2AE0**

■ **Overview**

Remote antennas increase the reliability of wireless links by optimizing the receiving and emission of signals.

- Use in Industrial Wireless LAN (IWLAN) and WLAN in accordance with IEEE 802.11 at 2.4 GHz and 5 GHz with transmission rates of up to 450 Mbit/s
- Coordinated range of antennas for the most diverse applications both indoors and outdoors
- Antennas with two (dual-slant) or three (MIMO) connections for increased data throughput and increased reliability of the wireless connection thanks to selective use of multiple path propagation
- Suitable for use in hazardous areas (Zone 2); no special approvals necessary

■ **Benefits**

g **get** Designed for Industry

- Investment protection thanks to compliance with the globally recognized standard IEEE 802.11 and – depending on the version – suitability for 2.4 GHz and/or 5 GHz
- Cost-effective connection to devices in remote, difficult-to-access, or hostile environments
- Establishment of a reliable IWLAN wireless infrastructure through the use of remote antennas, even if the access points and client modules are installed in the cabinet, for example

■ **Application**

Separate antennas optimize the transmission and receiving conditions and support the use of IWLAN products in a number of industrial applications. With directional antennas, conveyor lines or corridors can be covered by wireless or point-to-point links can be implemented at distances of up to several 1000 meters.

Alternatively, an omnidirectional antenna concentrates the wireless field around the antenna in the shape of a disc which enhances the quality of the connection.

Antennas with two or three connections enable transmission of the two to three streams usual with IEEE 802.11n, using just one antenna. They are available both with omnidirectional and directional characteristics.

Application examples:

Omnidirectional antennas

- Coverage of an area which has at its center a pole for mounting the antenna
- Installation of the antenna on the roof in the case of automated guided vehicle systems for reliable data exchange with the vehicles
- Wide-area coverage of a production cell or robot station

Directional antennas

- Communication between buildings over long distances with the help of an antenna with narrow opening angle and high gain
- Selective coverage of warehouse/high-bay warehouse aisles with the help of a wide-angle antenna prevents interference with neighboring wireless fields

■ **Design**

Overview of IWLAN antennas

■ **Function**

Separate antennas are used to optimize the wireless field for the application. In industrial applications, this supports a reliable wireless field.

Antennas with several connections (dual or MIMO antennas)

Antennas with two connections combine two individual antennas, at 90° to each other, in one antenna enclosure. With these antennas, two data streams can be transferred simultaneously thanks to the two different polarization levels. Depending on the alignment of the polarization levels, these antennas are referred to as dual-slant (rotated through +/-45°) or vertical-horizontal.

Antennas with three connections contain three individual emitters that can be combined in one enclosure, either on different polarization levels (0°, +/-45°) or at a suitable distance from each other. The MIMO antennas can transmit three data streams simultaneously using multiple path propagation.

Transmission of several data streams results in increased data throughput and simultaneously a more reliable data transfer.

Directional effect

The suitable antenna is selected first by means of the wireless field characteristic. A distinction is made between omni-directional antennas and directional antennas.

8

IWLAN antennas

■ **Function** (continued)

Omnidirectional antennas

Omni-directional antenna

With omni-directional antennas, the wireless field is emitted in every direction surrounding the antenna (horizontal opening angle: 360°), but it weakens as the distance increases. There is a concentration in the vertical direction which creates passive amplification of the wireless field. Many omni-directional antennas have extremely weak radiation directly below the antenna due to their type of construction. This property can be seen in the associated antenna diagram.

ANT795-4Mx

With these omni-directional antennas, the wireless field is concentrated at 2.4 GHz and 5 GHz in the vertical plane of the antenna. All antennas of this type have an opening angle of 30° in the vertical direction and an antenna gain of 4 dB. They are directly mounted on the R-SMA or N connector of the SCALANCE W enclosure.

For the use of SCALANCE W-700 in accordance with IEEE 802.11n:

ANT795-4MA, ANT795-4MC and ANT795-4MD

The ANT795-4MC and ANT 795-4MD antennas can be rotated around only one axis, they have N-Connect connectors and degree of protection IP65, and they are used with the SCALANCE W788 M12 Access Points and the SCALANCE W748 M12 Client Modules.

The ANT795-4MA antenna features an additional joint, an R-SMA connector, and degree of protection IP30. It is therefore optimally suitable for the SCALANCE W788 RJ45 Access Points and the SCALANCE W748 RJ45 Client Modules.

For the use of SCALANCE W-700 in accordance with IEEE 802.11a/b/g:

ANT795-4MR, ANT795-4MS

The ANT795-4MR antenna can only be rotated about one axis and, due to its IP65 degree of protection, it is mainly used for the SCALANCE W788 Access Points and the SCALANCE W744-1PRO, W746-1PRO and W747-1RR Client Modules. Two of these antennas are supplied with these access points or client modules.

The ANT795-4MS antenna features an additional joint and is therefore ideally suited to the SCALANCE W784 Access Points and the SCALANCE W744-1, W746-1 and W747-1 Client Modules.

ANT792-6MN, ANT793-6MN

With these omni-directional antennas, the wireless field is concentrated at 2.4 GHz (ANT792-6MN) and 5 GHz (ANT793-6MN) in the vertical plane of the antenna. The antennas have a gain of 6 dB and 5 dB respectively.

N-Connect is used as the connector and can be connected to SCALANCE W over an extension cable from the range of IWLAN cabling. Both antennas are supplied with a mounting aid (metal bracket) that supports wall or mast mounting. The antennas are therefore ideally suited, for example, to providing wireless coverage for a place that has a mast at its center on which they can be mounted.

ANT795-6MN, antenna mounting tool for ANT795-6MN

With this omni-directional antenna, the wireless field is concentrated at 2.4 GHz and 5 GHz in the vertical plane of the antenna. The antenna has a gain of 6 dB and 8 dB respectively.

N-Connect is used as the connector and can be connected to SCALANCE W over an extension cable from the range of IWLAN cabling. The antenna characteristic is such that good transmission properties also exist directly above and below the antenna. It is designed for mounting on a control cabinet or roof, but it can also be mounted under a roof, so it is suitable, for example, for the mobile units of an automated guided vehicle system. If it needs to be installed on a ceiling under a roof, the optional antenna mounting tool for ANT795-6MN is used.

ANT795-6MT

This antenna is an omnidirectional MIMO antenna with three QMA connections. The wireless field is concentrated at 2.4 GHz and 5 GHz in the vertical plane of the antenna. The antenna has a gain of 6 dB.

The antenna characteristic is such that good transmission properties also exist directly above and below the antenna. It is designed for mounting on a roof or (together with the supplied mounting bracket) under a ceiling, and it is thus suitable, for example, for the mobile units of an automated guided vehicle system.

The ANT795-6MT is connected to the SCALANCE W-700 Access Points in accordance with IEEE 802.11n via QMA/N-Connect male/female IWLAN adapter cables and the IWLAN flexible antenna connecting cables in the relevant length and connector version.

Function (continued)

Directional antennas

Directional antenna

With directional antennas, the wireless field is emitted both in the horizontal and vertical plane in the range of the opening angle. It is concentrated in these areas and generates passive amplification. They are ideally suited to wall or mast mounting. The direction can be aligned using the supplied mounting aid.

N-Connect is usually used as the connector and can be connected to SCALANCE W over an extension cable from the range of IWLAN cabling.

For the use of SCALANCE W-700 in accordance with IEEE 802.11n:

ANT795-6DC, ANT793-6DG and ANT793-6DT

The wireless field can be aligned at 2.4 GHz and 5 GHz using these wide-angle antennas. Each has an antenna gain of 9 dB.

Thanks to their characteristics, they are suitable, for example, for providing wireless coverage for an area in front of a wall.

The ANT795-6DC antenna is suitable for both frequency bands 2.4 and 5 GHz. It has an N-Connect connection. Two or three antennas of this type can also be used for covering several sectors.

ANT793-6DG is a dual-slant antenna with two N-Connect connections for the 5 GHz frequency band.

ANT793-6DT is a MIMO antenna with three QMA connections for the 5 GHz band.

The ANT795-6DT is connected to the SCALANCE W-700 Access Points in accordance with IEEE 802.11n via QMA/N-Connect male/female IWLAN adapter cables and the IWLAN flexible antenna connecting cables in the relevant length and connector version.

ANT792-8DN, ANT 793-8DJ and ANT793-8DK

These antennas enable genuine alignment of the wireless field. The wireless field is concentrated in a narrow cone due to the narrow opening angle. High passive gains and long ranges are therefore achieved.

Due to the high passive gain, the antennas are ideally suited to bridging large distances.

The ANT792-8DN antenna is suitable for the 2.4 GHz frequency band and has an antenna gain of 14 dB.

ANT793-8DJ (18 dB) and ANT793-8DK (23 dB) are strongly directional antennas with vertical-horizontal polarization. They each have two N-Connect connections.

For the use of SCALANCE W-700 in accordance with IEEE 802.11a/b/g:

ANT795-6DN

The wireless field can be aligned at 2.4 GHz and 5 GHz using this wide-angle antenna.

The antenna is suitable, for example, for providing wireless coverage for an area in front of a wall.

ANT792-8DN, ANT793-8DN

Genuine alignment of the wireless field at 2.4 GHz (ANT792-8DN) or 5 GHZ (ANT793-8DN) is achieved using these antennas. The wireless field is concentrated in a narrow cone due to the narrow opening angle. High passive gains and long ranges are therefore achieved.

Due to the high passive gain, the antennas are ideally suited to bridging large distances over IWLAN.

IWLAN – Accessories

IWLAN antennas

■ **Integration** (continued)

Antennas especially for use with RCoax radiating cables

These antennas have been specially developed for use with the RCoax radiating cable. They are preferably used in environments in which nodes move within limited areas or exclusively along predefined paths. Typical applications are suspended monorails or high-bay racking systems where the antenna is within the near field of the radiating cable.

ANT793-4MN

With this omni-directional antenna, the wireless field is concentrated at 5 GHz in the vertical plane of the antenna. The antenna has a gain of 6 dB at 5.2 GHz and 5 dB at 5.7 GHz. The polarization of the antenna is vertical (λ5/8 characteristic). N-Connect is used as the connector type, which can be connected to

SCALANCE W or the IWLAN/PB Link PN IO over an extension cable from the IWLAN connecting cable range.

ANT792-4DN

The wireless field is aligned at 2.4 GHz for this antenna. The antenna has a gain of 4 dB. The polarization of the antenna is circular, i.e. the receive path of the signals of both polarizations is amplified equally well. Signal strength fluctuations are weaker at 2.4 GHz.

N-Connect is used as the connector type, which can be connected to SCALANCE W or the IWLAN/PB-Link PN IO over an IWLAN extension cable.

■ **Integration**

SCALANCE W using the range of accessories with direct connection of an antenna, mounting in a control cabinet and using a lightning protection element

■ **Integration** (continued)

SCALANCE W788-1 RJ45 access points with MIMO antenna and SCALANCE W788-1 M12 with N-Connect connection

Industrial Wireless Communication
IWLAN – Accessories

IWLAN antennas

Ordering data	Order No.
Antennas with omnidirectional characteristic;	

National approvals, compact instructions on paper, German/English

For mounting directly onto SCALANCE W

Antenna gain incl. connector 4 dB, 2.4/5 GHz;

• **ANT795-4MC antenna;** IP65 (-20 to +65 °C), straight connection, N-Connect male, scope of delivery: 3 antennas	6GK5 795-4MC00-0AA3
• **ANT795-4MD antenna;** IP65 (-20 to +65 °C), connection with fixed 90° angle, N-Connect male, scope of delivery: 3 antennas	6GK5 795-4MD00-0AA3
• **ANT795-4MR antenna;** IP65 (-20 to +65 °C), scope of delivery: 1 antenna	6GK5 795-4MR00-0AA6
• **ANT795-4MA / ANT795-4MS antenna;** IP30; radial rotation possible with additional joint; R-SMA male	
- **ANT795-4MA;** scope of delivery: 3 antennas	6GK5 795-4MA00-0AA3
- **ANT795-4MS;** scope of delivery: 2 antennas	6GK5 795-4MS00-0AA6

Wall or mast mounting

• **ANT792-6MN antenna** Antenna gain incl. N-Connect connector 6 dB, 2.4 GHz; IP65 (-40 to +80 °C), with terminating resistor 1 x TI795-1R; incl. mounting hardware	6GK5 792-6MN00-0AA6
• **ANT793-6MN antenna** Antenna gain incl. N-Connect connector 5 dB, 5 GHz; IP65 (-45 to +70 °C), with terminating resistor 1 x TI795-1R; incl. mounting hardware	6GK5 793-6MN00-0AA6

For mounting on a roof

• **ANT795-6MN antenna** Antenna gain incl. N-Connect connector 6/8 dB, 2.4/5 GHz; IP65 (-40 to +80 °C), with terminating resistor 1 x TI795-1R	6GK5 795-6MN10-0AA6
• **ANT795-6MT antenna** MIMO antenna with 3 QMA sockets, antenna gain 6 dB, 2.4/5 GHz; (-40 to +85°C), incl. fixing bracket	6GK5 795-6MT00-0AA0
• **Antenna mounting tool (ANT795-6MN)** Mounting aid for installing ANT795-6MN below a roof	6GK5 795-6MN01-0AA6

Ordering data	Order No.
Directional antennas;	

incl. mounting hardware; compact instructions on paper, German/English

Wall or mast mounting

• **ANT795-6DC antenna** Wide-angle antenna, slightly directional; antenna gain incl. N-Connect connector 9/9 dB, 2.4/5 GHz, -40 to +80 °C	6GK5 795-6DC00-0AA0
• **ANT793-6DG antenna** Dual-slant wide-angle antenna, slightly directional; antenna gain incl. two N-Connect connectors 9 dB, 5 GHz, -40 bis +80 °C	6GK5 793-6DG00-0AA0
• **ANT793-6DT antenna** MIMO antenna with 3 QMA sockets, wide-angle antenna, slightly directional; antenna gain 9 dB, 5 GHz, -40 to +85 °C	6GK5 793-6DT00-0AA0
• **ANT795-6DN antenna** Wide-angle antenna, slightly directional; antenna gain incl. N-Connect connector 9/9 dB, 2.4/5 GHz, -40 to +80 °C; with terminating resistor 1 x TI795-1R	6GK5 795-6DN00-0AA6
• **ANT792-8DN antenna** Antenna, strongly directional; antenna gain incl. N-Connect connector 14 dB, 2.4 GHz; -40 to +80 °C; with terminating resistor 1 x TI795-1R	6GK5 792-8DN00-0AA6
• **ANT793-8DN antenna** Antenna, strongly directional; antenna gain incl. N-Connect connector 19 dB, 5 GHz, -45 to +70 °C; with terminating resistor 1 x TI795-1R	6GK5 793-8DN00-0AA6
• **ANT793-8DJ antenna** Vertically-horizontally polarized antenna, strongly directional; antenna gain incl. two N-Connect connectors 18 dB, 5 GHz; -45 to +70 °C	6GK5 793-8DJ00-0AA0
• **ANT793-8DK antenna** Vertically-horizontally polarized antenna, strongly directional; antenna gain incl. two N-Connect connectors 23 dB, 5 GHz; -45 to +70 °C	6GK5 793-8DK00-0AA0

Antennas for RCoax systems	
• **ANT792-4DN antenna** Circularly polarized RCoax helix antenna for RCoax systems; N-Connect female connection; antenna gain at 2.4 GHz 1 dB	6GK5 792-4DN00-0AA6
• **ANT793-4MN antenna** Vertically polarized RCoax 5/8 antenna for RCoax systems; N-Connect female connection; antenna gain at 5.2 GHz/ 5.7 GHZ 6/5 dB	6GK5 793-4MN00-0AA6

Industrial Wireless Communication
IWLAN – Accessories

IWLAN RCoax cables

Overview

The RCoax cables are radiating cables that function as special antennas for the SCALANCE W Access Points in environments with complex radio coverage. Its design means that a defined, cone-shaped radio field is generated along the RCoax cable. The radiating cables are therefore perfectly suitable for use in all types of applications with track-bound vehicles.

- Rugged coaxial cable which can be easily installed
- Two cables for use in the frequency bands 2.4 GHz and 5 GHz
- Connection as external antenna to SCALANCE W780 Access Points
- Connection of mobile nodes via SCALANCE W740 Client Modules and IWLAN/PB Link PN IO using an antenna aligned to the RCoax
- Suitable for use in hazardous areas (Zone 2); no special approvals necessary

Benefits

get **Designed for Industry**

- Reliable coverage in areas problematic for radio
- Avoidance of greater than desired WLAN expansion by means of defined emission of the radio waves
- Cost savings thanks to direct substitution of sliding contacts, trailing cables, and data light barriers
- Highly flexible laying

Design

The RCoax cables were specially designed for the frequency band around 2.4 GHz or 5 GHz respectively.

Openings are present in the outer conductor of the coaxial cable which permit the penetration and emission of radio waves. A defined radio field is then developed around the RCoax cables. Longitudinal damping and extraction loss are in a balanced relationship, which permits a long segment length of cable per SCALANCE W780 Access Point and an appropriate distance from the mobile station (SCALANCE W740, IWLAN/ PB Link PN IO) to the RCoax cable.

Coordinated accessories are available for assembly:
- IWLAN RCoax cable clip 1/2"
- IWLAN RCoax spacer 85 mm
- IWLAN RCoax threaded washer M6

Application

- In areas with demanding conditions for wireless coverage (e.g. in tunnels, channels and elevator shafts) where "unlimited" mobility is not of decisive importance, but where rather a mechanically wear-free and thus maintenance-free solution is required to ensure reliable data transmission: This is made possible by the defined radio field along the RCoax cable.
- The RCoax cables offer, especially for conveyor systems and every type of rail-mounted vehicle (suspended monorails, AGV systems) a wear-free and reliable wireless link.

Application examples

- Suspended monorail
- Automated guided vehicle systems (AGVS)
- Cranes
- Stacker cranes
- Transfer lines
- Tool-changing trolleys
- Tunnels
- Lifts

Configuration example with RCoax cable using example of a nutrunner control in automobile production

■ **Overview**

A comprehensive, coordinated range of coaxial accessories is offered for flexible combination and installation of the individual IWLAN components indoors and outdoors.

This range encompasses connecting cables as well as diverse connectors, lightning protection elements, a power splitter and an attenuator.

■ **Benefits**

get Designed for Industry

- Flexible use thanks to extensive, coordinated range
- Operation also outdoors with extended temperature range and protection against water and dust thanks to degree of protection IP65
- Components are suitable for use with SCALANCE W-700 including national approvals

■ **Application**

RCoax/antenna connecting cables

- The flexible IWLAN RCoax/antenna connecting cables are required for connecting RCoax segments or antennas with active devices.
- The cables offer low attenuation so that the quality of the radio signal is only reduced to a minimal extent.
- All antenna cables are flame-resistant, chemical-resistant and silicone-free.

Terminating resistors

- Terminating resistors are required for wireless termination of unused antenna connections at the access points and clients.
- RCoax segments must be terminated at the end with a terminating resistor.

Lightning protection elements

- When separate antennas are used outdoors, there is a risk of lightning strikes.
- A lightning protector can be used to prevent damage.

Cabinet feedthroughs

Together with the antenna connecting cables, the cabinet feedthroughs enable simple connection of remote antennas to the active components located in the control cabinet/box.

Attenuator

The 10 dB attenuator is always used when the transmitted power has to be reduced both in the send and receive directions. Typical application areas include short RCoax segments or directional wireless links, which are to be limited in extent.

Power splitter

- With the help of the power splitter, the transmission power of an access point is divided between two RCoax or antenna segments.
- This enables wireless coverage in two areas using just one access point.

Product versions

RCoax/antenna connecting cables

- Pre-assembled cable lengths (0.3 m to 10 m)
- Different connector types and combinations (N-Connect, R-SMA, SMA, QMA)

Terminating resistors

- TI795-1R: Terminating resistor 50 ohms for R-SMA antenna sockets
- TI795-1N: Terminating resistor 50 ohms for N-Connect antenna sockets or RCoax segments

Lightning protection elements

- LP798-2N: Maintenance-free lightning protection element for N-Connect connections
  - Quarter-wave system (lambda-quarter) for the frequency range 2 to 6 GHz
  - Represents a short-circuit for DC voltages so that all types of overvoltage can be reliably diverted
  - Not suitable for DC infeed via the antenna cable
- LP798-1N: Lightning protection element for N-Connect connections
  - With gas discharge arrester for the frequency range 0 to 6 GHz for N-Connect connections
  - Suitable for DC infeed via the antenna cable

Cabinet feedthroughs

- N-Connect female/SMA female with fastening flange for panel thicknesses up to 5.5 mm
- N-Connect female/N-Connect female without flange for panel thicknesses up to 4.5 mm
  - Can also be used to connect two antenna connecting cables

Overview

- The PS791-1 PRO power supply is an AC/DC power supply for input voltages of 90 to 265 V AC for numerous SCALANCE products with IP65 degree of protection.
- Mounting:
  - Wall mounting or on S7-300 rail, immediately under/next to the SCALANCE W788-xPRO and SCALANCE W788-xRR Access Points, SCALANCE W74x-1PRO and SCALANCE W74x-1RR Client Modules, or SCALANCE X-200PRO switches
- Robust metal housing with IP65 protection against water and dust
- Operating temperature -20 °C to +60 °C

Benefits

get Designed for Industry

- Reduced storage of replacement parts, as only one power supply unit is required for several SCALANCE products with IP65 degree of protection
- Global application due to wide input voltage range
- High reliability as power supply is short-circuit proof, secure against no-load operation and is able to bridge short breaks in the mains power
- Variety of possible applications thanks to:
  - wide range of input voltages
  - high degree of efficiency
  - low heat dissipation

Design

- Fanless design and rugged metal casing; High protection against dust and splashwater with IP65 degree of protection
- Operating temperatures from -20 °C to +60 °C
- Resistant to condensation
- Connection to AC network via AC Power 3+PE cable connector (included)
- Connection to SCALANCE products in degree of protection IP65
- In other applications, the Power M12 Plug PRO is used for the DC-output (to be ordered separately)
- Direct mounting is possible on the SCALANCE products with IP65 degree of protection using supplied installation material; also suitable for wall-mounting or mounting on standard mounting rail (S7-300)

Example for the use of power supply PS791-1PRO with SCALANCE X and SCALANCE W

Note:
When SCALANCE W is connected to SCALANCE X208PRO, the power supply in the hybrid connector is not available; power must be supplied via the M12 plug connector.

Power supply PS791-1PRO

◼ Technical specifications

Order No.	6GK5 791-1PS00-0AA6
Product type designation	**Power supply PS791-1PRO**
Interfaces	• AC Power 3+PE cable connector for 100 … 240 V AC feed • M12 Plug PRO or Power Cord M12 for 24 V DC output voltage • On/Off switch
Input voltage	90 … 265 V AC at 47 … 63 Hz
Output voltage	24 V DC, +-7 %, 0.42 A
Output power	10 W
System disturbances	Stored energy time at least 20 ms at 230 V AC
Permissible ambient conditions • Operating temperature • Transport/storage temperature • Relative humidity	 -20°C … 60°C -40°C … +85°C 100 %
Approvals	EMC: EN 55022 Class B, EN 61000-4; UL 1950, EN 60950;
Device failure	MTBF 600,000 h at full load, 25°C
Switching frequency	typ. 100 kHz
Degree of protection	IP65
Dimensions (W x H x D) in mm	125 x 60 x 130
Assembly	Wall/DIN rail mounting (S7-300) directly on SCALANCE devices
Weight	700 g

Overview

PS791-2DC power supply adapter

- DC/DC power supply unit for input voltages from 12 to 24 V DC and an output voltage of 18 V DC for all SCALANCE W786 devices

PS791-2AC power supply adapter

- AC/DC power supply unit for input voltages from 100 to 240 V AC and an output voltage of 18 V DC for all SCALANCE W786 devices

Benefits

get Designed for Industry

- The PS791-2DC and PS791-2AC power supply adapters are designed specially for the SCALANCE W786 access points and are integrated direct into these
- Global application due to wide input voltage range
- High reliability as power supply is short-circuit proof, secure against no-load operation and is able to bridge short breaks in the mains power
- When the power supply adapter and Power-over-Ethernet (PoE) are used, redundant power supply of the access points can be achieved

Design

- Integral power supply adapter for SCALANCE W786
- Fan-free design
- Operating temperatures from -40 °C to +70 °C
- Resistant to condensation

■ **Function**

- Input/output fields
  for displaying and changing of process values.

- Function keys
  are used for directly triggering functions and actions.
  Up to 16 functions can be configured simultaneously on
  function keys. The function keys can also be used directly
  as PROFINET IO.
  The function keys can also be reconfigured as system keys.
  A frequently used function such as "Acknowledge alarm" can
  thus be assigned to a function key.

- Auxiliary operator controls
  such as handwheels, key switches and illuminated
  pushbuttons can be assigned with a variable or as a direct
  actuation via PROFINET IO (direct keys).

- Buttons
  are used for direct triggering of functions and actions. Up to
  16 functions can be configured simultaneously on buttons.

- Graphics
  can be used as symbols instead of text for "labeling" function
  keys or buttons. They can also be used as full-screen
  background images.
  In the configuration software, a comprehensive library is
  available containing graphics and a wide variety of objects.
  All editors with an OLE interface can be used as graphics
  editors (such as PaintShop, Designer or CorelDraw).

- Vector graphics
  simple geometric basic forms (e.g. lines, circles and
  rectangles) can be created directly in the configuration
  software.

- Text fields
  for labeling function keys, process displays, and process
  values in any font size.

- Trend views and bars
  are used for the graphic display of dynamic values.

- Display selection from the controller
  permits operator prompting from the controller.

- Presentation of HTML documents with MS Pocket Internet
  Explorer.

- Visual Basic Script, flexibility thanks to the implementation of
  new functions including linking to variables (comparison
  operations, loops, etc.).

- Language switching
  16 online languages, 32 configuration languages incl. Asiatic
  and Cyrillic character sets
  - Language-dependent texts and graphics

- User administration (security)
  - User-oriented access protection according to requirements
    of specific sectors
  - Authentication with user name and password
  - User-group-specific rights

- Signaling system
  - Discrete and analog alarms (edge alarms) as well as the
    ALARM_S message frame procedure for SIMATIC S7
  - Freely definable message classes (e.g. status/fault
    messages) for definition of acknowledgment response and
    display of alarm events

- Message buffer
  - Non-volatile, maintenance-free and battery-free message
    buffer. The messages remain stored when the mobile panel
    has the battery removed as well

- Recipe management
  - With additional data storage
    (on optional MultiMedia Card/SD Card)
  - Online/offline processing on the panel
  - Storage of recipe data in standard Windows format (CSV)
  - External processing using standard tools such as Excel and
    Access is possible

- Help texts
  for process images, messages and variables.

- Arithmetic functions

- Limit value monitoring
  for reliable process control of inputs and outputs.

- Indicator lights
  for machine and plant status indication.

- Scheduler
  for cyclic function processing.

- Dynamic positioning of objects and dynamic showing/hiding
  of objects

- Permanent window and template concept
  - Creation of screen templates:

- Simple maintenance and configuration thanks to:
  - Backup/restore of the project, operating system, recipe data
    records and firmware on the optional standard multi-media
    card/SD card
  - Backup and restoration of configuration, operating system,
    recipe data sets and firmware on a PC using ProSave
  - Project transfer/return transfer via PROFINET/WLAN
  - Automatic transfer detection
  - Individual brightness setting
  - Project simulation directly on the configuration computer

- WinCC flexible options
  - Sm@rtService for remote operator control and monitoring of
    SIMATIC HMI systems based on TCP/IP networks
  - Sm@rtAccess for communication between HMI systems
    based on TCP/IP networks. Remote access to recipe data
    records, passwords and HMI system-specific information,
    and much more. (Mobile Panel 277F IWLAN as server: View
    only)
  - OPC server: Communication with applications
    (e.g. MES, ERP, or applications in the office sector) from
    various manufacturers (see HMI software/runtime software
    SIMATIC WinCC flexible/WinCC flexible RT options)
  - Audit

Industrial Wireless Communication
IWLAN – Wireless Devices

SIMATIC Mobile Panel 277(F) IWLAN

■ **Function** (continued)

Configuration

Configuration is carried out with the SIMATIC WinCC flexible Standard or Advanced configuration software (see SIMATIC WinCC flexible HMI software/engineering software). SIMATIC WinCC flexible is the logical further development of the field-proven ProTool family. Projects generated using ProTool can be easily migrated to WinCC. If WinCC flexible is started directly from SIMATIC Manager, data in STEP 7 can be accessed directly when the panel is configured. Duplicated data input and data management is, therefore, avoided.

IWLAN infrastructure

The required IWLAN infrastructure is set up with the IWLAN Access Points SCALANCE W-780, preferably with the version SCALANCE W786-2RR, which fully supports all possible applications of the Mobile Panel 277(F) IWLAN. For operating a plant without fail-safe communication, the version SCALANCE W786-1PRO can also be used. The iPCF functionality (rapid roaming = fast, uninterrupted switchover between several access points) is only available with V2 panels upwards.

The Access Point provides an Industrial Ethernet interface for connection to the wired network.

In addition to a reliable radio link, the SCALANCE W-780 Access Points stand out due to their optimum support of standardized IT mechanisms:

• IEEE 802.11b/ g/ a/ h for different frequency ranges
• IEEE 802.11e for multimedia, wireless multimedia (WMM) [1]
• IEEE 802.11i for security [1]
• Construction of redundant networks with the Rapid Spanning Tree Protocol (RSTP)
• Virtual networks (VLAN) to logically separate, for example, different user groups
• Sending the log entries of the SCALANCE W devices to a Syslog server

Wireless approvals

Only those wireless approvals printed on the mobile panel apply. Planned wireless approvals for all SIMATIC products can be found on the Internet at:
www.siemens.com/wireless-approvals

[1] Not supported by Mobile Panel Wireless

■ **Integration**

The SIMATIC Mobile Panel 277(F) IWLAN communicates via the WLAN Standard IEEE 802.11 a(b/g) via PROFINET. The Mobile Panel 277F IWLAN devices also support PROFIsafe communication.

There are five device versions with V2:

For mobile operation and monitoring via WLAN:
• Mobile Panel 277 IWLAN V2
• Mobile Panel 277 IWLAN V2 with handwheel, key switch and illuminated pushbuttons

As fail-safe device for safety-oriented operation as well:
• Mobile Panel 277F IWLAN V2 with acknowledgement button and emergency stop button
• Mobile Panel 277F IWLAN V2 with acknowledgement button, emergency stop button, handwheel, key switch and illuminated pushbuttons
• Mobile Panel 277F IWLAN RFID Tag (for V2 only)

For the versions Mobile Panel 277F IWLAN (PROFIsafe), the following system prerequisites apply:
• The Mobile Panel must be connected as a safe device (PROFIsafe, Distributed Safety)
• Use of a SIMATIC F-CPU

SIMATIC Mobile Panel		5 GHz frequency band (IEEE 802.11a)	SIMATIC F-CPU (Distributed Safety)
277 IWLAN	Only WLAN utilization (HMI)	●	–
	When using transponders	!	–
	When using Profinet IO	●	–
277F IWLAN (fail-safe)		!	!
277F IWLAN (RFID Tag) (fail-safe)		●	!

● = Recommended

! = Requirement

– = Not required

The Mobile Panel 277(F) IWLAN can be connected to:
• SIMATIC S7-200/-300/-400 (one F-CPU required for integrating the Mobile Panel 277F IWLAN and SIMOTION (Mobile Panel 277 IWLAN V2 or higher, or Mobile Panel 277FIWLAN V2 or higher (WinCC flexible 2008 SP3 or higher))

Note:
Further information can be found under "System interfaces". The Function Manuals "Fail-Safe Operation of the Mobile Panel 277F IWLAN" are available for downloading in English, German, and Japanese.

Overview

Interface module for handling communication between ET 200pro and host PROFINET IO controllers over Industrial Wireless LAN (IWLAN) radio networks for 2.4 GHz or 5 GHz with data transfer rates up to 54 Mbit/s.

- Protection against illegal access, espionage, tapping and falsification through use of effective encryption mechanisms
- Fast exchange of devices through use of interchangeable medium MICRO MEMORY CARD

Overview

PN	DP-M	DP-S	ASi-M		
●	●				

- Compact router between Industrial Wireless LAN (IWLAN) and PROFIBUS
- Wireless connection to IWLAN (e.g. SCALANCE W Access Points) according to IEEE 802.11a/b/g/h with up to 54 Mbit/s at 2.4 GHz and 5 GHz
- PROFINET IO proxy;
  connection of PROFIBUS DP slaves to PROFINET IO controller according to PROFINET standard:
  - From the viewpoint of the IO controller, all DP slaves are handled like I/O devices with Ethernet interface, i.e. the IWLAN/PB Link PN IO is their proxy.
  - From the viewpoint of the DP slaves, the IWLAN/PB Link PN IO is the DP master
- High, deterministic data throughput and very fast roaming through support of iPCF; the iPCF mechanism represents an extension of the IEEE 802.11 standard and must be available both on the station and on the access point, e.g. SCALANCE W788-1RR
- Full support of the security options defined in the IEEE 802.11i standard for authentication via WPA2 with TLS, TTLS, PEAP
- High degree of protection against unauthorized access thanks to 128-bit encoding (AES)
- Direct substitution of solutions with Power Rail Booster for PROFIBUS with non-contact data transmission technology; Advantages: no wear of sliding contacts
- Cross-network PG/OP communication by means of S7 routing, i.e. all S7 stations can be remotely programmed using the programming device on the Industrial Ethernet or PROFIBUS.
- Cross-network access to data of S7 stations for visualization by means of S7 OPC server and S7 routing;
  via the IE/PB Link PN IO access can be made from the PC on the Industrial Ethernet (e.g. for HMI applications with OPC client interface) to all data of the S7 stations on the PROFIBUS by means of the S7 OPC server.
- Module replacement without the need for a programming device, using the C-PLUG swap media for backing up the configuration data
- Configuring in STEP 7

Benefits

get **Designed for Industry**

- High mobility;
  increased plant availability through wireless data transmission to mobile communication partners, e.g. to control an automated guided vehicle system (AGVS)
- Wear-free;
  contact-free technology with RCoax as a substitute for contact wires, e.g. for suspended monorails
- Investment protection;
  integration of PROFIBUS field devices into an IWLAN radio network
- Also enables use in plants with PROFIsafe applications
- Flexible use ensured by connecting the antenna best suited to the respective application (e.g. for operation on RCoax radiating cable)

Application

The IWLAN/PB Link PN IO supports the use of an IWLAN, for example with RCoax radiating cables, for wireless data transmission in the case of suspended monorails, storage and retrieval systems, or other applications with mobile stations. Support of PROFINET means that the wide variety of PROFIBUS system services, such as diagnostics over the bus, can still be utilized.

- Suspended monorails;
  vehicle controllers for suspended monorails can be implemented economically on the basis of SIMATIC components. High availability, short response times and easy expansion are achieved by using distributed controllers, such as SIMATIC ET 200S IM 151/CPU. With the aid of the IWLAN/PB Link PN IO, the vehicle controllers can continue to be used without change. The user can also program them remotely with STEP 7 over IWLAN.
- Storage and retrieval systems;
  with these systems, data light barriers requiring intensive maintenance and offering no flexibility can be replaced by an IWLAN solution. This enhances plant availability.

8

IWLAN/PB Link PN IO

Design

The IWLAN/PB Link PN IO is snapped onto a standard mounting rail. The external dimensions are the same as those of the Power Rail Booster enclosure. The IP20 degree of protection ensures that the IWLAN/PB Link PN IO is suitable for installation in the control cabinet.

- Compact construction;
  the rugged plastic enclosure features the following on the front panel:
  - an R-SMA interface for connecting an antenna, e.g. for operation on the RCoax radiating cable
  - a 9-pin sub-D socket for connection to PROFIBUS
  - a 4-pin terminal strip for connecting the external supply voltage of 24 V DC.
  - Diagnostic LEDs
- Can be operated without a fan
- Fast device replacement in the event of a fault by using the optional C-PLUG swap medium (not included in scope of supply)

Function

PROFINET

- PROFINET IO proxy;
  wireless connection of PROFIBUS DP slaves to PROFINET IO Controller according to PROFINET standard. Using the IWLAN/PB Link PN IO as a proxy, you can continue to use existing PROFIBUS devices (also with PROFIsafe functionality, V2.0 or higher) and integrate them into a PROFINET application.

Vertical integration

- S7 routing;
  permits cross-network PG communication, in other words, all S7 stations on the IWLAN/Industrial Ethernet or PROFIBUS can be programmed remotely using the programming device. Access can be made to visualization data of S7 stations on the PROFIBUS from HMI stations on the IWLAN/Industrial Ethernet.
- Data set routing (PROFIBUS DP);
  using this option, the IWLAN/PB Link PN IO can be used as a router for data sets that are forwarded to field devices (DP slaves). SIMATIC PDM (**P**rocess **D**evice **M**anager) is a tool that creates data sets of this type for parameterizing and diagnosing field devices.
  It is possible, for example, to use SIMATIC PDM (on the PC) to set parameters and perform diagnostics for a PROFIBUS PA field device on the IWLAN/Industrial Ethernet over the IWLAN/PB Link PN IO and DP/PA Coupler/Link.
  The additional functions for vertical integration can also be used in an existing PROFIBUS application without PROFINET for connection to a higher-level IWLAN/Industrial Ethernet. In this case, the IWLAN/PB Link PN IO is used as an additional DP-Master Class 2 on a PROFIBUS segment for linking to the IWLAN/Industrial Ethernet and offers the above functions.

Diagnosis

Extensive diagnostic options are available via STEP 7 or SNMP, including:

- Diagnosis of the assigned PROFIBUS field devices; using the IWLAN/PB Link PN IO as a proxy, the connected DP slaves can be diagnosed in the same manner as PROFINET IO devices (even in the user program of the PROFINET IO controller)
- General diagnostics and statistics functions
- Connection diagnostics
- Diagnostic buffer
- Integration into network management systems through the support of SNMP V1 MIB-II

Configuration

STEP 7 V5.4 or higher or the TIA Portal is required for configuring the full functional scope of the IWLAN/PB Link PN IO.

For the IWLAN/PB Link PN IO, STEP 7 automatically generates the necessary parameters, e.g. the ones that assign addresses, and all necessary routing information.

The configuration data for PROFINET IO created with STEP 7 is saved on the IO controller. Attention must however be paid to the memory capacity. The initialization data for the Ethernet interface is backed up on the C-PLUG (Configuration Plug) swap media. The IWLAN/PB Link PN IO can be swapped in the event of failure without a programming device, because the relevant user and configuration data is saved on the IO controller or on the C-PLUG.

Integration

System solution with IWLAN/PB Link PN IO using example of suspended monorail

Transfer rates	
• Radio	1 … 54 Mbit/s
- standards supported	IEEE 802.11a, 802.11b, 802.11g, 802.11h, 802.11i
• PROFIBUS	9.6 kbit/s to 12 Mbit/s incl. 45.45 kbit/s (PROFIBUS PA)
Interfaces	
• Connection to Industrial Wireless LAN	R-SMA antenna socket
• Connection to PROFIBUS	9-pin Sub-D socket
- maximum segment length for PROFIBUS [1]	20 m
- maximum current consumption at the PROFIBUS interface with connection of network components (for example, optical network components)	100 mA at 5 V
• Connection for power supply	4-pin terminal block
Power supply [2]	2 supplies for 20.4 … 28.8 V DC
Current consumption (at rated voltage)	
• external from 24 V DC, max.	300 mA
Power loss	approx. 6.5 W
Perm. ambient conditions	
• Operating temperature	0 … + 60 °C
• Transport/storage temperature	- 40 … + 70 °C
• Relative humidity, max.	95 % at +25 °C
Design	
• Module format	Power Rail Booster enclosure
• Dimensions (W x H x D) in mm	90 x 132 x 75
• Weight	approx. 300 g
Degree of protection	IP20
Configuration	
Configuration software	STEP 7/NCM S7 with V5.3 SP2 or later plus Hardware Support Package for IWLAN/PB Link PN IO

Product type designation	IWLAN/PB Link PN IO
Performance data	
PROFINET communication	
• Number of DP slaves on the IWLAN/PB Link PN IO (PROFINET IO-Devices for PROFINET IO)	max. 8
• Number of DP inputs	max. 256 byte
• Number of DP outputs	max. 256 byte
Additional functionality	
• Number of S7 connections	max. 8
• Number of DSGW connections	max. 8

[1] A repeater is required if the specified length is exceeded
[2] The power supply is electrically isolated; a high-impedance connection (>700 kΩ) exists to the contact spring for mounting of the enclosure on the DIN rail).

Industrial Wireless Communication
Engineering/network management/diagnostics

SINEMA E

Overview

- Engineering tool for support with planning, configuration, simulation and measurement of an IWLAN radio field on site (Site Survey) according to the IEEE 802.11 a/b/g/h standard
- Automatic determination of the WLAN infrastructure for new and existing networks
- Optimization functions for minimization of channel interference
- Visualization and analysis of WLAN networks according to signal strength, data rate, signal-to-noise ratio, overlapping and applications (PROFINET, TCP/IP, Voice over WLAN)
- Configuration of single and multiple devices as well as uploading/downloading of IWLAN device parameters
- Site survey functions (measurements) for the acquisition, conditioning, evaluation and visualization of measured WLAN signals
- Integrated and expandable catalog entries for WLAN devices, antennas and radio hindrances as well as standard graphics formats for importing layout plans
- Report function for documenting the configured and measured WLAN infrastructure

Benefits

get — Designed for Industry

- Quick and easy creation of WLAN applications for industrial and office environments indoors and outdoors thanks to functions for
  - automatic detection of the optimal WLAN infrastructure
  - minimization of channel interference
  - simulation of changes to device properties, to predict the operating principle of real networks
  - wizard-supported project and tender preparation
- Minimization of the configuration and start-up outlay thanks to grouped offline and online functions
- Reduction of configuration errors through inherent consistency check
- Analysis of the the performance of existing WLAN networks through measurement and evaluation functions
  - at the beginning or for verification of start-up
  - for troubleshooting and optimization during maintenance and servicing
- Report function including the planning and measurement results for offer generation, device installation instructions and plant documentation
- Extendable catalogs for integration of further
  - WLAN devices (to the IEEE 802.11 a/b/g/h standard)
  - obstacles to radio waves, through the measurement and/or input of attenuation values

■ **Application**

SINEMA E (**SI**MATIC **Ne**twork **Ma**nager Engineering) is the generic term for the engineering of network products such as SCALANCE W.

Application diagram of the SINEMA E software for planning and measuring WLAN networks

SINEMA E 2006 contains the following functions for the engineering of IWLAN networks:

Technical clarification

• Wizard-supported tender preparation

Planning

• Measurement (site survey) of an existing WLAN network
• Planning, simulation, and optimization of a WLAN infra-structure
  - Simultaneous configuring of device groups
  - Generation of a report with installation guidelines

Start-up

• Identification, upload/download from devices
• Measurement (site survey) for verification and optimization of planning
• Report for final documentation

Maintenance and service

• Optimization and fault rectification with the help of measure-ments (site survey)

The functional scope of the software is subdivided into "lean" and "standard" licenses. With the standard license, additional functions are possible for the acquisition, evaluation and visualization of measured WLAN signals (site survey) as well as extended simulation and planning (automatic placement, contour presentation, storage/comparison of simulations, extended filter options).

Industrial Wireless Communication
Engineering/network management/diagnostics

SINEMA E

▇ Function

The SINEMA E software (**SI**MATIC **NE**twork **MA**nager **E**ngineering) provides the user with various different tools for planning, configuration, simulation and measurement (site survey) of WLAN networks.

Modeling, simulation, visualization, and optimization

Special algorithms in **SINEMA E** allow the operating principle of WLAN networks to be predicted taking into account environmental sources of interference. Catalogs provided in the software that contain known sources of interference (e.g. walls, machines, and tools) make it easy to model even the most difficult environments at the office desk quickly and accurately. If required, obstacles specific to the environment can be accurately determined with local measurements and added to the catalog.

Using the software, the properties of Access Points and Client Modules, such as channel settings/transmitted power, and their antennas can be changed to ensure that the optimal configuration is achieved for the real network.

Following simulation, all signal parameters such as range, data rate, attenuation, etc. can be evaluated using several different views. At any time, therefore, the quality of the WLAN can be predicted inside and outside buildings and gaps in security can be closed.

The "standard" license also offers integrated expert functions such as automatic placement and channel optimization, which determine the necessary access points and optimize the device parameters. The "standard" license also supports visualization with contours, further filter options, the comparison of saved simulations and the creation of application profiles for PROFINET, TCP/IP, and Voice over WLAN.

Multi-device setting of access points and clients

The parameters of all SCALANCE W access points and clients are part of the SINEMA E project and can be set accordingly. Common parameters of these devices can be combined in a group and therefore set more rapidly.

Configuring with SINEMA E can also be carried out without the hardware being present. SINEMA E checks the consistency of the configuration, thus preventing faulty settings.

Initial startup and configuration

Simply by pressing a key, SINEMA E identifies all IWLAN nodes which can be accessed online, and transmits all basic parameters of these devices, such as IP addresses etc., during initial commissioning.

Further devices which are not yet included in the project are also detected, and their configuration data can be added to the project.

The initial startup can be carried out from any point in the same subnetwork. Further settings and configurations can then also be transmitted from other subnetworks in the Ethernet network to all devices in the project by pressing a key.

WLAN site survey (measurement), evaluation and visualization

SINEMA E is a complete tool for measurement (site survey) of existing WLAN networks according to the IEEE 802.11 a/b/g/h standard. WLAN signals can be measured using this at the start of planning or for verification during commissioning as well as for troubleshooting during maintenance and servicing.

The software saves received measured values of the WLAN adapter used with the coordinates in the floor plan and links them together. Different methods are available for measurement and evaluation to suit the application.

Standard measuring technique

The WLAN adapter used for measurement is always connected to a previously defined WLAN network (SSID). Properties such as speed, signal strength and roaming behavior of the existing client access point connection are determined.

For continuous measurements along a route, it is sufficient to set a start and end point to enable all additional measuring coordinates to be automatically determined by the software. The WLAN connection properties of a client can then be measured quickly even in the case of large areas.

Advanced measuring technique

All WLAN signals in the environment are scanned so that signals from known and unknown devices can be acquired.

Using the filter functions of SINEMA, such as minimum, maximum, average value, measurements from a wide range of different points in time can be combined and analyzed.

Sales wizard

For creating an offer for IWLAN applications of an industrial plant (Level 1)

SINEMA E report function

The report function supplies an up-to-date project overview at every phase of the engineering process.

A report always comprises a project device list with order numbers and antennas as well as installation coordinates inside and outside the modeling environment. The format and scope of the HTML report can be changed using the software. All the planning and measurement graphics can be inserted as well as later plant photos, logos, etc. without the need for any special software.

The report permits quotations to be generated at an early point in time, and devices can be installed for commissioning using the coordinates data. The report is an important document following commissioning and during service and maintenance.

Industrial Wireless Communication
WirelessHART

Introduction

■ **Overview**

HART (**H**ighway **A**ddressable **R**emote **T**ransducer) is the protocol for bus-addressed field devices. It is not a fieldbus, but a version of the digital field communication that contains many of the functionalities of fieldbuses.

WirelessHART is the wireless HART communication to field-buses in the process industry. The HART Communication Foundation (HCF) specified WirelessHART and published it as part of the HART standard V7.1. The radio transmission is based on the wireless communications standard IEEE 802.15.4. High availability is achieved by means of the meshed network architecture (each field device is simultaneously a repeater) with redundant communication paths and constantly changing frequency channels (channel hopping). 128-bit encryption in conjunction with authentication and validation of each data packet ensures secure data transfer and prevents unauthorized access to the field devices.

As a basic principle, a WirelessHART network consists of WirelessHART field devices and a WirelessHART gateway that receives the data from the field devices and forwards it to the automation system.

8

SITRANS P280

Overview

SITRANS P280 for flexible and cost-effective applications in pressure monitoring

- Supports the WirelessHART standard (HART V 7.1)
- Very high security level for wireless data transmission
- Built-in local user interface (LUI) with 3-button operation
- Optimum representation and readability using graphical display (104 x 80 pixels) with integrated backlight
- Stand-by (deep sleep phase) can be activated and deactivated device with push of a button
- Battery power supply
- Battery life time up to 5 years
- Extend battery life time with switch off the HART modem interface
- Optimized power consumption through new design, and increase in battery life time
- Simple configuration thanks to SIMATIC PDM
- Device meets IP65 degree of protection
- Can be used for absolute and gauge pressure measurements

Note:
You can find more information in Catalog FI 01 and in the Industry Mall at www.siemens.com/industrymall

Industrial Wireless Communication
WirelessHART

SITRANS AW200

Overview

SITRANS AW200 WirelessHART Adapter

The SITRANS AW200 WirelessHART adapter is a battery-powered communication component, which integrates HART and 4 ... 20 mA field devices into a WirelessHART network. On the wireless communication side, the adapter supports the WirelessHART standard. HART and 4 ... 20 mA field devices are connected on the field device side.

The SITRANS AW200 WirelessHART adapter

- supports the WirelessHART standard (HART V 7.1)
- features a very high degree of security for wireless data transmission
- integrates one 4 ... 20 mA field device or up to four HART field devices (in multidrop mode) into a WirelessHART network
- features intelligent energy management for the power supply of connected field devices
- can be easily parameterized using SIMATIC PDM

■ Overview

- The IE/WSN-PA LINK is a gateway for the connection of WirelessHART field devices (HART V7.1) to Industrial Ethernet, as an alternative or supplement to the wired connection.
- Connection of up to 100 WirelessHART devices
- Approved for operation in hazardous areas in Zone 2
- Open TCP/IP communication and Modbus TCP via the Ethernet interface
- Can be used with HART-OPC servers of the HART Communication Foundation

Note:
A general introduction to WirelessHART and information on the WirelessHART adapter and the WirelessHART field devices can be found in Catalog FI 01 or on the Internet at
www.siemens.com/wirelesshart

■ Benefits

g e**get** Designed for Industry

- Extended possible solutions for connecting process industry field devices by means of alternative or supplementary WirelessHART communication
- Reliable data transmission using intermeshed network technology; the self-organizing network with alternative paths enables radio obstacles to be bypassed
- Reduction of cabling costs under difficult installation conditions, e.g. if the field devices are located on inaccessible plant components or are only required temporarily
- To improve process monitoring and for maintenance tasks, sensors can be retrofitted
- Existing transmitters can be integrated wirelessly into maintenance and diagnostics systems by means of WirelessHART adapters
- Without additional software, restricted monitoring is possible via web services and the integrated web server of the IE/WSN-PA LINK.

■ Application

The IE/WSN-PA LINK connects wireless HART field devices by radio to the Ethernet. On the radio side, the IE/WSN-PA LINK supports the WirelessHART standard and on the Ethernet side the TCP/IP and Modbus TCP communication.

The IE/WSN-PA LINK thus enables wireless diagnostics, maintenance and process monitoring.

Monitoring

WirelessHART is particularly suitable for use in plant sections that are to be included in monitoring, but which do not have any existing MSR cabling, e.g. external tank stores or other installations where high cabling costs are anticipated. Data for the visualization can be retrieved from the IE/WSN-PA LINK via Industrial Ethernet or Modbus TCP.

Monitoring of process states via WirelessHART

8

Application (continued)

Retrofitting for diagnostics and maintenance

For this application, wireless adapters are looped into the 4-20 mA interface or screwed directly onto the HART device. The acyclic HART message frames are transmitted by radio between IE/WSN-PA LINK and a wireless adapter. Without affecting the operation of the plant, the wireless adapter modulates the acyclic HART message frames to the 4-20 mA interface or extracts them from the 4-20 mA interface.

The IE/WSN-PA LINK collects the data of all wireless adapters and transfers it via Industrial Ethernet to the diagnostics and maintenance station.

If greater distances between the IE/WSN-PA LINK and the monitoring station are to be spanned without cabling, this can be implemented by means of Industrial Wireless LAN with the access points and client modules of the SCALANCE W family.

Retrofitting of plants for diagnostics and maintenance

Design

- 2 x 10/100/1000 Mbit/s RJ45 ports, electrical (no integral switch; interfaces can be used, for example, for continuous connection to the plant network as well as the temporary connection of a PC)
- 1 x screw terminal for connection to Modbus RTU via RS485
- 1 x screw terminal for the 24 V DC connection
- Rugged metal enclosure with IP65 protection for use outdoors, also in hazardous zone 2
- Mounting: wall or mast mounting (vertical); U-bolts for mast mounting are included in the scope of delivery.

Product versions

- With integral, non-detachable antenna
- With N connector for connection of external antennas

Function

WirelessHART

The IE/WSN-PA LINK establishes on the radio side an inter-meshed wireless sensor network for communication with wireless field devices (e.g. transmitters). The data from the wireless field devices is received by the IE/WSN-PA LINK and transmitted via Industrial Ethernet to the connected systems. The supported wireless network is an open wireless network specified by the HART Communication Foundation (HCF) in accordance with the WirelessHART (HART V7.1) standard.

On the field device side, the IE/WSN-PA LINK requires field devices that support WirelessHART (HART). Existing field devices can be integrated by means of wireless adapters into the WirelessHART communication. To this end, the adapters are looped into the 4-20 mA interface. In addition, as many as four standard HART field devices with external power supply can be connected to the adapter in multidrop mode. Individually connected devices can be operated with the battery of the adapter.

The adapter wirelessly transmits all data and process values of the connected devices. The advantage of this solution is that tried and tested devices can continue to be used.

Industrial Ethernet

Via the Ethernet interface the IE/WSN-PA LINK supports the use of the HART OPC server and the Modbus TCP protocol.

Configuration

The configuration is web-based, without additional software, and performed from the PC. By means of the web user interface it is also possible to display the device states and measured values of the WirelessHART devices.

■ Integration

Integration into automation systems

The IE/WSN-PA LINK can be integrated into automation systems via Ethernet or Modbus TCP. Communication modules (CP 343-1 or CP 443-1) are required to connect the IE/WSN-PA LINK to SIMATIC S7-300/400. Function blocks and technical support can be found at:

www.siemens.com/simatic-net/ik-info

Integration in PCS 7

For integration of the IE/WSN-PA LINK into PCS 7 you can obtain function blocks and technical support at:

Industrial Remote Communication

9

Industrial Remote Communication

Introduction

Overview

Industrial Remote Communication offers efficient remote access to machines and plants with SIMATIC. Global remote access to far-flung plants, remote machines and mobile applications is gaining in significance – both in industry and in industry-related areas. With a comprehensive range of solutions for industrial remote access, Siemens offers the ideal basis for efficient and reliable monitoring and control of widely distributed plants and processes of any size.

In addition to efficient remote access (Remote Access), Industrial Remote Communication also offers with the network components the option of transparent data links to remote networks via public or private wide area networks (WAN).

In this way, for example, a video transmission in real time via mobile radio from the passenger cell of trains serves to increase passenger safety (video surveillance). In addition, applications such as data interfacing for ticket machines, infotainment services and Internet on board, or proactive monitoring of vehicle engineering (telemetry) are also possible.

Secure and flexible access worldwide

Industrial plants are often distributed over large areas – sometimes even across national borders. Siemens offers proven solutions for industrial remote access, such as flexible telecontrol systems and efficient remote maintenance. Whether in public infrastructure or in the manufacturing or process industries: With the components for Industrial Remote Access, Siemens offers comprehensive solutions for telecontrol and teleservice.

Telecontrol

Telecontrol involves the connection of distant process stations to one or more central control systems. Various different public or private networks can be used for communication for the purposes of monitoring and control. Event-driven or cyclic exchange of process data is performed with special telecontrol protocols and enables the operating personnel to manage the overall process effectively.

The telecontrol systems are based on SIMATIC. They supplement the SIMATIC system with corresponding hardware and software, and thus permit individual components to be networked over a WAN (Wide Area Network). The data for this is transmitted via classical WANs, e.g. dedicated cables, telephone network, wireless, but also via IP-based networks such as mobile networks or the Internet.

Teleservice (remote diagnostics and remote maintenance)

Teleservice is data exchange with physically remote technical plants (machines, plants, computers, etc.) for the purpose of error detection, diagnostics, maintenance, repair, or optimization.

Remote diagnostics and remote maintenance of production plants are indispensable in modern automation technology. They are more efficient and more cost-effective than an on-site service employee on site. This allows faults to be detected and cleared much faster, downtimes of machines are reduced and their availability is increased.

Siemens Remote Services

The service concept of "Siemens Remote Services" provides a powerful, secure platform for remote access to machines and plants. The inclusion of "Shared Experts" ensures effective support, not only from Siemens but also from the internal company specialists.

9

■ Overview

Industrial plants in the process industry or in public infra-structure areas are often spread across wide areas, sometimes even across national borders. The range of telecontrol products offers complete solutions with the following features:

- Connection of distributed process stations to one or more control centers
- Use of different public or private communication networks for monitoring and controlling the telecontrol substations
- Event-driven or cyclic exchange of the process data including time stamp via special telecontrol protocols
- Effective control of the overall process by the operating personnel
- Online access to the substations for diagnostics, remote programming and maintenance

TeleControl Basic

TeleControl Basic is a simple telecontrol and remote mainte-nance system optimized for substations connected wirelessly via GPRS.

It comprises the TeleControl Server Basic control center software and substations of the type SIMATIC S7-1200 or S7-200. In addition to communication between the control center and the substations, the system also enables internode communication between the substations.

Small-scale applications with few outstations can be imple-mented, as well as large-scale plants comprising up to 5000 outstations.

TeleControl Professional

TeleControl Professional includes telecontrol systems for extensive, expanded applications of the process industry. From SIMATIC PCS 7, SIMATIC WinCC or non-Siemens control systems using OPC, outstations based on SIMATIC S7-300 and S7-400 can be monitored and controlled. The outstations and substations can communicate with each other as well as with one or more control centers. TeleControl Professional has a modular design throughout and can be used with extreme flexibility.

Both telecontrol systems can be connected to a non-Siemens control center system (OPC client) via OPC.

9

Industrial Remote Communication
Telecontrol

■ Overview (continued)

Example configuration for TeleControl Professional with SINAUT ST7

■ Benefits

- Secure and economic remote monitoring and control of process stations
- Global remote access to widely distributed machines and plants
- Quick and easy commissioning due to perfectly matched system components

■ More information

You can find more information on the Internet at:

www.siemens.com/telecontrol

Overview

TeleControl Basic is based on SIMATIC S7-1200/S7-200 and is the low-cost solution for monitoring and controlling simple telecontrol stations.

With TeleControl Basic, up to 5000 substations can easily and securely communicate with one another and with the control center using GPRS (**G**eneral **P**acket **R**adio **S**ervice) mobile radio. They typically remain permanently online.

Benefits

g e**t**
get Designed for Industry

- Saving of costs for design and maintenance of own radio system through use of existing mobile radio networks
- Low-cost GPRS volume tariffs reduce the monthly connection charges
- A GPRS connection is permanently online, i.e. it offers the advantages of a dedicated line
- Secure connection over public networks thanks to encrypted data transfer
- Support for bidirectional connections
  - Between station and control center
  - Between station and station
- Remote maintenance and remote programming of the substations during process operation

Application

TeleControl Basic is based on SIMATIC S7-1200/S7-200 and GPRS. It is particularly suitable wherever small data quantities have to be transmitted over wireless connections.

TeleControl Basic can be used as a low-cost fault signaling system, but thanks to the bidirectional communications facility, it is also suitable for simple telecontrol tasks for monitoring and control.

Depending on the performance power of the CPU in the substations, local automation tasks can be handled in addition to communication.

Main applications are the monitoring and control of non-mobile stations in the following sectors:

- Water and wastewater
- Drinking water purification and distribution
- Irrigation systems
- Oil and gas supplies
- District heating networks
- Automatic machines
- Traffic control systems
- Building monitoring
- Weather stations
- Lighthouses and buoys
- Wind power plants
- Photovoltaic plants
- Environmental monitoring equipment
- Intelligent advertising panels

In addition, TeleControl Basic can also be used to link mobile stations if central monitoring and/or control is required for these:

- Railway vehicles
- Special vehicles
- Local public transport
- Complex building machines
- Ships on rivers and in coastal areas

Design

TeleControl Basic consists of the following components:

- **CP 1242-7 GPRS communication module;**
  communication processor for GPRS and GSM communication for setting up substations of the type S7-1200
- **MD720-3**;
  modem for GPRS and GSM communication for the structure of SIMATIC S7 substations e.g. S7-200
- **TeleControl Server Basic**
  software package consisting of:
  - OPC server software for the PC control center;
    for data exchange with an OPC client, e.g. WinCC, PCS 7 or WinCC flexible
  - Connection manager for the PC control center;
    for establishing a secure GPRS connection with CP 1242-7 or SINAUT MD720-3, for monitoring these connections, and for data routing with internode communication between substations of the same type (S7-1200 or S7-200)

The CP 1242-7 is plugged straight into the S7-1200, and is connected to the CPU via the backplane bus. The substation is programmed and configured with STEP 7 Basic/Professional V11.

The MD720-3 modem has an RS232 interface and is connected to the S7-200 controller using the Siemens PPI adapter.

9

Industrial Remote Communication
TeleControl Basic

Function

Communication options with TeleControl Basic

Process data communication

The TeleControl Server Basic software enables the connection of up to 5000 telecontrol stations to the control center via the OPC interface using GPRS.

TeleControl Server Basic is an OPC server software with special communications functions, which permit it to support connections to remote telecontrol substations. These controls are equipped with the CP 1242-7 or the MD720-3 modem. The GPRS service (**G**eneral **P**acket **R**adio **S**ervice) of a GSM network (**G**lobal **S**ystem for **M**obile Communication) is used for the connections.

Via these GPRS connections, the remote telecontrol substations can communicate with the TeleControl Server Basic software or with other S7 controllers connected with TeleControl Server Basic.

The PC on which TeleControl Server Basic is installed must be permanently accessible from the GPRS network. It must therefore be directly connected to the GPRS provider using a dedicated line, or permanently to the Internet, e.g. by means of DSL.

The TeleControl Basic software package includes a block library for the SIMATIC S7-200 controller. With the help of these blocks, users can implement the following types of data exchange with S7-200 substations.

For substations of the type S7-1200, the blocks for the CP 1242-7 are included in STEP 7 Basic V11.0

Alarm output per text message

The CP 1242-7 can receive and send text messages. A mobile phone or S7-1200 can be the communication partner.

Wake-up function

"Wake-up" of stations that change from standby mode to online mode for diagnostics purposes. The CP is wakened up by its communication partner (e.g. TeleControl Server Basic) by means of a wake-up call or a wake-up text message to establish the connection between them.

For security reasons, the communication partner must identify itself appropriately for the wake-up function, e.g. using the CLIP function.

Access to the substations using Teleservice

Telecontrol Server Basic includes the Teleservice function direct in STEP 7 Basic V11.0 for the CP 1242-7. This provides internationally active plant and machine manufacturers with global access to the S7-1200 stations.

Up to three telephone numbers can be saved on the SINAUT MD720-3 modem, from which a teleservice connection is permissible. If a call is made from one of the approved numbers, the MD720-3 interrupts the GPRS connection and switches through the teleservice connection to the PLC. The GPRS connection is reestablished at the end of the teleservice session.

9

Overview

- Software package for the PC, comprising:
  - OPC server and connection manager for telecontrol and teleservice tasks (diagnostics with STEP 7 for the S7-1200)
  - OPC configuring software for the S7-1200 and S7-200
  - PLC block library for the S7-200
- GPRS operation
  - of the SIMATIC S7-1200 with CP 1242-7 via dynamic IP addresses with a standard mobile phone flat-rate contract
  - of the SIMATIC S7-200 with SINAUT modem MD720-3 via dynamic IP addresses with a standard mobile phone flat-rate contract
  - of the S7-1200 with CP 1242-7 via fixed IP addresses
- Connection of up to 5000 telecontrol stations to the control center via the OPC interface
- Operation and diagnostics of S7-1200 and S7-200 stations on an OPC server with different STEP 7 projects and separate users with user administration
- Integral teleservice gateway for diagnostics of S7-1200 stations via the CP 1242-7 with STEP 7 via the Internet, also with dynamic IP addresses. This works on every PC with STEP 7 and standard Internet access without parameterizing firewalls or routers.
- GPRS communication between S7-1200 or S7-200 stations by means of routing function (also when using dynamic IP addresses)
- Encrypted transmission for protection against data manipulation and tapping
- Import of SINAUT MICRO SC projects

Benefits

get Designed for Industry

- Setup of low-cost alarm signaling systems, monitoring systems, and telecontrol systems with SIMATIC S7-1200, S7-200 and HMI software with OPC interface (e.g. with WinCC, WinCC flexible)
- Low-cost connection of plants spread across national borders by operating SIMATIC S7 via public APNs (mobile wireless Internet gateway) with standard mobile phone flat-rate contracts, independently of individual mobile wireless operators
- Alternatively, GPRS mode of the SIMATIC S7 via private APNs of the mobile wireless operators for maximum security
- Optimized communication modes for GPRS save on data volumes and thus costs:
  - with permanent connection by means of optimized communication with effective frame format
  - Support for GPRS connections that are built up as required
- The multi-user capability and multi-project capability of the OPC server allow it to be used by system integrators who can allow their customers to use their own server for telecontrol applications. This achieves savings for customers (power costs, server maintenance).
- Teleservice:
  TeleControl Server Basic provides internationally active plant and mechanical equipment manufacturers with global access to the S7-1200 via STEP 7 using the CP 1242-7. It only requires GPRS access of the S7 controller and a PC with STEP 7 and Internet access.
- The central control station can be located anywhere thanks to use of the Internet
- Investment protection thanks to migration of existing projects with SINAUT MICRO SC in TeleControl Server Basic
- Protection against tapping and manipulation of transmitted data between the S7-1200/S7-200 station and the OPC server of the TeleControl Server Basic by means of encryption algorithms
- Fast detection of faults thanks to clearly structured connection and station monitoring of all connected S7-1200 and S7-200 stations
- Fast creation of projects thanks to off-the-shelf sample applications

9

Industrial Remote Communication
TeleControl Basic for the control center

TeleControl Server Basic

Application

- Establishment of small to extremely extensive systems for monitoring and control with simple telecontrol stations
- Energy-saving concepts, e.g. through status-dependent speed control of pumps in remote stations
- Monitoring and control of non-mobile stations in the following sectors:
  - Sewage plants
  - Drinking water purification and distribution
  - Irrigation systems
  - Oil and gas supplies
  - District heating networks
  - Automatic machines
  - Traffic control systems
  - Building monitoring
  - Weather stations
  - Lighthouses and buoys
  - Wind farms
  - Photovoltaic plants
  - Environmental monitoring equipment
  - Intelligent advertising panels

- Connection of mobile stations if central monitoring and/or control is required for these, in the following areas:
  - Railway vehicles
  - Control of special vehicles
  - Local public transport
  - Complex building machines
- Ships in inland and coastal waters (see sample applications for satellite-supported live tracking with map representation and position-dependent control functions)
- Recording of environmental data
- Remote diagnosing of the SIMATIC S7-1200 with STEP 7 via the mobile wireless network and the Internet

TeleControl Server Basic: Diagnosing an S7-1200 with dynamic or fixed IP address via the Internet and mobile wireless network

Design

The TeleControl Server Basic software package consists of:
- Block library for the SIMATIC S7-200 CPU
- OPC server software for the PC control center
  - for data exchange with an OPC client, e.g. WinCC or WinCC flexible
- Connection manager software for the PC control center
  - for establishing a secure GPRS connection between an S7 station with a CP 1242-7 or an MD720-3 modem, and the OPC server
  - for monitoring these connections
  - for data routing in the case of slave-to-slave communication between SIMATIC S7-1200 and S7-1200, and S7-200 and S7-200

■ **Function**

GPRS communication with CP 1242-7 and TeleControl Server Basic

- Connection of up to 5000 stations to one TeleControl Server Basic OPC server;
  by connecting several TeleControl Server Basic 5000 OPC servers to one OPC client, more than 5000 stations can be connected to one control center

- Support for large projects:
  - Multi-project-capable: Several STEP 7 telecontrol projects can be organized in up to 2000 groups
  - Multi-user-capable engineering: Simultaneous configuring by several users is possible
  - Support for configuring similar S7 stations
  - Step-by-step commissioning of stations and station groups
  - Expansions during runtime without interrupting operation
  - Shared operation of stations connected via private (M2M contract) or public APNs

- Access to variables of the SIMATIC S7-1200 and S7-200 via the OPC interface by means of WinCC, WinCC flexible or standard OPC clients for control systems

- Wireless communication between S7-1200 stations and S7-200 stations using the integral routing function via TeleControl Server Basic also with dynamic IP addresses

- Adjustable communication options:
  - Teleservice: STEP 7 diagnostics (V11 or higher) over the Internet; the S7-1200 GPRS Internet connection can be activated for teleservice either by the machine or plant operator, or via an authorized wake-up function by the programmer or maintenance technician (if this function has been enabled).
  - Permanent GPRS connection for cyclic or event-oriented data transfer (S7-200 and S7-1200)
  - Establishment of the GPRS connection if required by the OPC client (automatic wake-up via text message) or by the S7-1200 (S7-1200 only)
  - Configuration of monitoring time and time synchronization of S7 stations

- The PC on which the TeleControl Server Basic software is installed must be permanently accessible via a fixed IP address over the Internet, using DSL, for example, or it must have a dedicated line direct to the GPRS provider.

Security

- Password authentication for connection buildup by a SIMATIC S7-200 station

- Optional double user authentication in the case of diagnostics via the Teleservice gateway function of TeleControl Server Basic and the CP 1242-7

- Secured data traffic between S7, the Internet and TeleControl Server Basic by means of encryption algorithms

Industrial Remote Communication
TeleControl Basic for the control center

TeleControl Server Basic

Function (continued)

Diagnostics

- Integrated diagnostic functions for
  - Group status signal of a project in a tree structure
  - Status of each station (GSM diagnostics information, PLC status)
  - Monitoring of temporary GPRS connections
  - "Wake-up" of stations that change from standby mode to online mode for diagnostics purposes
  - STEP 7 diagnostics of the S7-1200 via the CP 1242-7 module (with dynamic or fixed IP provider address) from any PC with Internet access. The connection between the S7 and the STEP 7 PC to the TeleControl Server Basic is established here. The connection between STEP 7 and the S7 is established automatically via the Teleservice gateway function.
  - Establishment of the connection between the S7 and TeleControl Server Basic can also be optionally initiated via a mobile phone (authenticated).

Operation of TeleControl Server Basic together with SINAUT ST7

TeleControl Server Basic and SINAUT ST7 operate with different protocols during data transmission. It is possible to combine a TeleControl Server Basic system with a SINAUT ST7 system in one SCADA system. This is carried out in the PC of the control center via the OPC server of TeleControl Server Basic.

Merging of TeleControl Server Basic with SINAUT ST7 when using WinCC in the control center

Merging of TeleControl Server Basic with SINAUT ST7 when using a non-Siemens system in the control center

Technical specifications

Product type designation	TeleControl Server Basic V2
Supported controllers	S7-1200 with CP1242-7 S7-200/S7-1200 with MD720-3 modem (block library included in the scope of supply)
Number of connections (stations) that can be operated (depending on the order version)	8, 64, 256, 1000, or 5000 connections
Number of STEP 7 projects that can be operated in parallel	2000 projects (structured representation, separation of the projects via programmable user rights)
Number of STEP 7 Teleservice connections that can be operated in parallel	5 connections per project (separation of the projects via programmable user rights)
Interfaces to the OPC Client	• DCOM protocol • OPC interface "Data Access Interface 3.0" • Synchronous and asynchronous reading of variables
Interfaces and functions between the OPC server and SIMATIC S7	• Writing of variables in the SIMATIC S7 in the case of value changes to OPC variables • Transfer of SIMATIC S7 data to OPC variables (for event-driven communication from the SIMATIC S7) • Activatable cyclic reading of variables; adjustable time interval • Monitoring of connected SIMATIC S7 with time-of-day synchronization • Routing of data packets between connected SIMATIC S7-1200 stations or between S7-200 stations • Permanent GPRS connection; the tunnel is established from the GPRS modem • Temporary GPRS connection (as required); the tunnel is established from the GPRS modem and can be initiated by a text message sent automatically by the OPC server ("wake-up"). Manual "wake-up" using a mobile phone is also possible. • Via Internet access as server with public IP address (recommendation: fixed public Internet address)
Operating systems	Microsoft Windows 7 Professional (32-bit) Microsoft Windows 7 Enterprise (32-bit) Microsoft Windows 7 Ultimate (32-bit) Microsoft Windows 2008 Server (32-bit)
Diagnostics	Station group monitoring Station monitoring Connection monitoring STEP 7 Teleservice across Internet and router boundaries – S7-1200 only
Configuration	Integral configuration tool Multi-project-capable Multi-user-capable with user management Configurations can be expanded at runtime

■ **Ordering data**	Order No.		Order No.

TeleControl Server Basic

Software for 8 to 5000 stations; Single License for one installation; OPC server for GPRS communication with SIMATIC S7-1200 and SIMATIC S7-200; connection management to remote GPRS stations; routing for connections between S7 GPRS stations; German and English operator interface; for Windows 7 Professional, Windows 7 Enterprise, Windows 7 Ultimate and Windows Server 2008 (32-bit); documentation on CD-ROM, German and English

Accessories

CP 1242-7 communication processor   **6GK7 242-7KX30-0XE0**

Communications processor for connecting SIMATIC S7-1200 to GSM/GPRS mobile wireless network

MD720-3 GSM/GPRS modem   **6NH9 720-3AA00**

GPRS modem for IP-based data transmission over GSM networks, quad band, AT command interface, automatic establishment of GPRS connection, switchable to CSD mode, RS232, including gender changer for RS232/ PPI adapter; manual on CD-ROM in German, English, Chinese, Russian

ANT794-4MR antenna   **6NH9 860-1AA00**

Quad band antenna, omnidirectional with 5 m cable

ANT794-3M antenna   **6NH9 870-1AA00**

Triband flat antenna, in enclosure with 1.2 m cable

9

Industrial Remote Communication
TeleControl Basic for the substations

CP 1242-7 GPRS module

■ Overview

The CP 1242-7 communication processor is used to connect a SIMATIC S7-1200 to the globally widespread GSM/GPRS mobile radio network and has the following characteristics:

- Worldwide wireless exchange of data between S7-1200 controllers and/or between S7-1200 controllers and control centers with an Internet connection
- Communication based on the GPRS (**G**eneral **P**acket **R**adio **S**ervice) mobile wireless service with data transmission speeds of up to 86 kbit/s in the downlink and 43 kbit/s in the uplink
- GPRS mode with fixed IP addresses and dynamic IP addresses with standard mobile phone contract
- Time synchronization on the basis of NTP (**N**etwork **T**ime **P**rotocol)
- On-demand connection buildup via voice call or text message
- Sending and receiving of text messages
- Clearly laid out LED signaling for fast and easy diagnostics
- Compact industrial enclosure in S7-1200 design for mounting on a standard mounting rail
- Fast commissioning thanks to easy configuration using STEP 7

In conjunction with the "TeleControl Server Basic" software, the CP 1242-7 forms a telecontrol system with further properties:

- Connection of up to 5000 telecontrol stations to the control center via an OPC interface
- Data buffering in the substations in the event of connection failures
- Central status monitoring of the substations
- No special provider services required for fixed IP addresses
- Teleservice access with STEP 7 to the substations via the Internet

■ Benefits

g **e**_{**get**}**t**   Designed for Industry

Connection of the S7-1200 to a mobile wireless network turns the controller into a telecontrol substation (remote terminal unit) suitable for universal use.

- Data connection of difficult-to-access areas without high network infrastructure costs since the existing mobile wireless network can is used
- Machine maintenance without complicated integration into the end customer's IT networks
- Reduced maintenance and travel costs thanks to centralized management of remote automation solutions

The CP 1242-7 has been specially developed to meet the requirements of telecontrol systems in automation solutions:

- Avoidance of data loss thanks to rugged connection to the control center and buffering of the data
- Fast commissioning thanks to direct configuring using STEP 7

■ Application

- Data exchange and centralized data monitoring for automation solutions spread over large geographical areas
- Establishment of permanent or temporary communication link for mobile machines/vehicles without permanent location
- Global remote access to the end customer's machinery in compliance with IT security requirements
- Connection of difficult-to-access external stations without a network infrastructure

These applications can be found in the most diverse sectors:

- Water/wastewater treatment plants – pump/valve controllers
- Traffic and transportation – traffic light controls, lighting controls
- Power engineering – monitoring of transformer stations, meter readout
- Mechanical engineering – centralized remote maintenance of machines used around the world
- Wind energy – condition monitoring of wind turbines
- Vending machine manufacturers – monitoring, control of beverage vending machines

9

CP 1242-7 GPRS module

Design

The CP 1242-7 offers all the advantages of the S7-1200 design:

- Rugged, compact plastic enclosure
- Easily accessible connection and diagnostics elements, protected by front flaps
- Removable connecting terminals
- Simple mounting on the mounting rail of the S7-1200
- 3-pin plug-in terminal strip for connection of the 24 V DC external supply voltage
- SMA connection for GSM/GPRS antennas

The CP 1242-7 is plugged into the left-hand system bus interface of the S7-1200. The power is supplied via a 3-pin terminal strip on top of the module. The antenna socket and the SIM card slot are located on the underside of the module, protected by the lower front flap.

Function

In conjunction with the "TeleControl Server Basic" software, the CP 1242-7 forms a telecontrol system on the basis of mobile wireless communication.

The external stations can be connected to the control center either continuously or as required. A higher-level control center system can exchange data with all stations via OPC. A service PC with STEP 7 can connect to any station via the control center for maintenance purposes.

Connection of a SIMATIC S7-1200 with CP 1242-7 to the GSM/GPRS mobile wireless network.

Industrial Remote Communication
TeleControl Basic for the substations

CP 1242-7 GPRS module

■ **Function** (continued)

Operating modes

The CP 1242-7 can be used in two different operating modes:

Telecontrol server

In this mode, communication with the control center and other telecontrol stations is handled via a central telecontrol server. The CP 1242-7 is connected to the telecontrol server. The "TeleControl Server Basic" software forwards the data to the control station or other telecontrol stations and monitors it.

GPRS Direct

In this mode, the CP 1242-7 communicates direct with a control center or other telecontrol stations. In contrast to telecontrol mode, this requires no telecontrol server or additional software. This mode can be selected if there is a guarantee that the communication partners of the station can be reached using a unique address. To ensure this, special network operator services, frequently referred to as machine-to-machine (M2M), have to be used in normal cases.

Configuration

All the necessary information (provider data, access rights, operating modes) is configured with STEP 7. STEP 7 Basic V11 or higher is required for configuring the CP 1242-7.

The data can also be reconfigured during runtime. A special library function is available for this purpose.

Data buffering

Brief connection failures in the mobile wireless network are bridged by data buffering. When the connection has been restored, the buffered data is time-stamped and sent.

Time synchronization

The mechanism for time-of-day synchronization of the CP 1242-7 can be set dependent on the operating mode.

If a telecontrol server is used in the control center, the control center forwards the time of day to all substations. If TeleControl Server Basic is not used, synchronization can take place via an NTP server.

The CPU program can use this time to set the internal time-of-day for the station.

Function library

A function library for the following functions is available for the CP 1242-7:

- Data exchange: Send and receive functions enable data exchange with other stations or with the control center.
- Sending/receiving text messages
- Configuration: Reconfiguring can take place during operation with the help of a function block

Diagnostics/remote maintenance

An online connection to a remote S7-1200 station with CP 1242-7 can be established from STEP 7 via GPRS/Internet. After the connection has been established, all the familiar online functions for remote maintenance (download, diagnostics) are available.

■ **Technical specifications**

Order No.	6GK7 242-7KX30-0XE0
Product type designation	CP 1242-7
Transmission rate	
Transmission rate with GPRS transfer	
• For uplink maximum	43 kbit/s
• For downlink maximum	86 kbit/s
Wireless technology	
Type of mobile wireless service supported	
• SMS	Yes
• GPRS	Yes
Type of mobile wireless service-note	GPRS (Multislot Class 10)
Type of mobile wireless network supported	
• GSM	Yes
• UMTS	No
Operating frequency	
• 850 MHz	Yes
• 900 MHz	Yes
• 1800 MHz	Yes
• 1900 MHz	Yes
Transmit power	
• At operating frequency 850 MHz	2 W
• At operating frequency 900 MHz	2 W
• At operating frequency 1800 MHz	1 W
• At operating frequency 1900 MHz	1 W

Order No.	6GK7 242-7KX30-0XE0
Product type designation	CP 1242-7
Interfaces	
Number of electrical connections	
• for external antenna(s)	1
• for power supply	1
Number of slots for SIM cards	1
Design of electrical connection	
• for external antenna(s)	SMA socket (50 Ohm)
• for power supply	3-pin terminal strip
Design of SIM card slot	Slot under front flap
Supply voltage, current consumption, power loss	
Type of power supply	DC
External power supply	24 V
Relative positive tolerance at 24 V DC	20 %
Relative negative tolerance at 24 V DC	20 %
Current input from external power supply at 24 V DC	
• Typical	0.1 A
• Maximum	0.22 A
Effective power loss	2.4 W

9

Technical specifications (continued)

Order No.	6GK7 242-7KX30-0XE0
Product type designation	CP 1242-7
Permitted ambient conditions	
Ambient temperature	
• with vertical installation during operation	0 … 45 °C
• with horizontal installation during operation	0 … 55 °C
• During storage	-40 … +70 °C
• During transport	-40 … +70 °C
• Note	-
Relative humidity at 25 °C without condensation during operation, maximum	95 %
IP degree of protection	IP20
Design, dimensions and weights	
Module format	S7-1200 compact module, single width
Width	30 mm
Height	100 mm
Depth	75 mm
Net weight	0.133 kg
Product properties, functions, components General	
Number of modules	
• Per CPU, maximum	3
• Note	-
Performance data	
Performance data open communication	
Number of possible connections for open communication by means of TC blocks, maximum	5
Data volume as user data per send call, maximum	2 048 bytes
Performance data S7 communication	
Number of possible connections for S7 communication	
• Maximum	-
• For PG connections, maximum	-
• For PG/OP connections, maximum	-
• Note	-

Order No.	6GK7 242-7KX30-0XE0
Product type designation	CP 1242-7
Performance data Telecontrol	
Connection to the control center	TeleControl Server Basic
• Note	Connection to Scada system by means of OPC interface
• by means of permanent connection	is supported
• by means of on-demand connection	is supported
Protocol is supported	
• DNP3	No
• IEC 60870-5	No
Product function: data buffering if connection is aborted	Yes
• Note	up to 1000 message frames
Data volume as user data per station in telecontrol mode, maximum	2 048 bytes
Performance data Teleservice	
Diagnostics function: online diagnostics with SIMATIC STEP 7	Yes
Product function: program download with SIMATIC STEP 7	Yes
Product function: remote firmware update	No
Product functions Management, configuration, programming	
Configuration software required	STEP 7 Basic V11.0 or higher
Product functions Security	
Product function: password protection for teleservice access	Yes
Product function: encrypted data transmission	Yes
Product functions Time	
NTP protocol is supported	Yes

MD720-3 GSM/GPRS modem

Overview

- GSM/GPRS mobile wireless modem with RS232 interface
- DIN rail mounting
- 24 V DC power supply
- Supports the GSM services CSD [1], SMS and GPRS
- Use with TeleControl Basic:
  Data transfer over tunneled GPRS connection with SIMATIC S7
- Use with SINAUT ST7:
  Data transmission via CSD, GPRS, transmission of text messages
- AT command interface: For remote maintenance via CSD with TS Adapter II or for transmitting text messages

[1] CSD – **C**ircuit **S**witched **D**ata (data transmission via GSM dialup connection)

Benefits

g e t **get** Designed for Industry

- Can be used worldwide due to quad band technology (observe national regulations!)
- Quick assembly due to standard rail mounting

For GPRS operation in combination with TeleControl Server Basic:

- Low operating costs for a permanent wireless online connection due to optimized communication with efficient message format
- Central control station is location-independent as result of Internet link between mobile radio provider and OPC server
- Secure connection over public networks through encrypted data transmission plus additional measures of the GPRS provider
- Simple configuration of wireless connected plants without specialist radio knowledge
- Modem replacement is possible by non-specialists since parameterization is carried out through the S7-200
- Cost savings thanks to remote servicing and remote programming
- Fast generation of applications by means of coordinated combination of automation components with the Micro Automation Set 21 (www.siemens.com/microset)

9

MD720-3 GSM/GPRS modem

Application

- GSM modem for the SINAUT ST7 telecontrol system for data transmission via dialup connection (CSD service)
- GSM modem for the TeleControl Basic system for data transmission via GPRS
- Construction of systems for monitoring and controlling of simple telecontrol stations
- Energy-saving concepts for plants, e.g. by means of status-dependent speed control of pumps in remote stations

- Control and monitoring of, for example:
  - Sewage treatment plants, water treatment
  - Oil and gas supplies
  - District heating networks
  - Power distribution
  - Pumping stations
  - Automatic machines
  - Traffic control systems
  - Buildings
  - Intelligent advertising panels
  - Weather stations
  - Lighthouses and buoys
  - Wind energy and photovoltaic plants
- Linking of mobile stations, with central monitoring/control of track vehicles, special vehicles, local public transport, complex building machines, ships on rivers and in coastal areas
- Remote programming and maintenance of the SIMATIC S7-200 via a GSM dialup connection (CSD service)

GPRS communication between SIMATIC S7-200 with MD720-3 and TeleControl Server Basic

MD720-3 GSM/GPRS modem

Design

- Rugged plastic enclosure for DIN rail mounting
- 9-pin Sub-D socket with RS232 interface (PPI adapter for SIMATIC S7-200 necessary)
- Diagnostics LEDs for modem status, field strength and connection check
- SET service key
- 4-pin screw terminal for connection to the 24 V DC supply voltage
- SMA connection for GSM/GPRS antennas

Function

- Quad-band GSM with the frequency bands 850/900/1800/1900 MHz
- GPRS Multislot Class 10 (gross: 13.4-27 kbit/s upload, 40-54 kbit/s download).
- Automatic establishment and holding of IP-based online connection over GPRS to the Internet
- Data exchange with PC-based application TeleControl Server Basic (router and OPC server); data exchange with further MD720-3 modems possible over routing of TeleControl Server Basic
- Hot switchover between GPRS and CSD (modem operation)
- CSD and GPRS connection controllable using AT commands
- Approved replacement for the GSM kit MC45 through compatible AT commands when used with SINAUT ST7 modules
- Sending of SMS and fax (via SMS) using GSM services
- Remote programming of S7-200 with MicroWin in GSM modem mode (CSD mode)
- Secure access to SIMATIC S7-200 data, also over mobile radio provider networks which do not provide public and fixed IP addresses for the modem

Configuration

- Parameterization using PLC blocks with the Micro/Win programming tool for SIMATIC S7-200;
- PLC blocks are part of TeleControl Server Basic
- AT command interface

Security

- Approval of up to 3 call numbers for incoming GSM connections (CLIP function) for teleservice
- User name and password for GSM connection
- Unlimited client and server operation even in protected GPRS networks with private IP addresses of the mobile radio providers
- Secure data transfer in GPRS mode between modem, Internet and TeleControl Server Basic using encryption algorithms

Diagnostics / maintenance

- Status of establishment of connection, and of an existing connection on front LED display
- Reading of configuration data over the RS232 interface
- Connection status to modem and to PLC can be monitored in TeleControl Basic
- Direct, additional access over GSM (modem operation) for teleservice (remote programming, remote diagnostics)

Industrial Remote Communication
TeleControl Basic for the substations

MD720-3 GSM/GPRS modem

■ Technical specifications

Order No.	6NH9 720-3AA00
Product type designation	**GPRS modem MD 720-3**
Transfer rate	
• RS232	300 bit/s to 57,600 bit/s
• GSM data calls	CSD 9,600 bit/s
• GPRS	
- Up to 2 uplinks	13.4 kbit/s to 27 kbit/s gross upload (modem to Internet); net approx. 30 % lower
- Up to 4 downlinks	40 kbit/s to 54 kbit/s gross download (Internet to modem); net is approx. 30 % lower
Interfaces	
• RS232	1 x 9-pin Sub-D socket
• Antenna connection	1 x SMA antenna socket (50 Ohm)
Frequency ranges	850, 900, 1800, 1900 MHz
Transmitted output power	2 W at 850, 900 MHz 1 W at 1800, 1900 MHz
Current consumption	
Send mode	
• at 12 V	430 mA
• at 24 V	140 mA
Receive mode	
• at 12 V	90 mA
• at 24 V	50 mA

Order No.	6NH9 720-3AA00
Product type designation	**GPRS modem MD 720-3**
Supply voltage	12 … 30 V DC
Power loss	typ. 5 W max. 6.2 W
Permissible ambient conditions	
• Operating temperature	- 20 °C … +60 °C
• Transport/storage temperature	- 25 °C … +85 °C
• Relative humidity	Max. 95 % at +25 °C
Design	
• Dimensions (W x H x D) in mm	22.5 x 99 x 114
• Weight	Approx. 150 g
• Assembly	Standard rail
Degree of protection	IP40
Configuration	AT commands using S7-200 program blocks; MC45-compatible AT commands for use with SINAUT ST7 modules
National approvals	Current approvals can be found in the Internet at www.siemens.com/simatic-net/ik-info

SIPLUS MD720-3 GSM/GPRS modem

■ Overview

- GSM/GPRS mobile radio modem with RS232 interface
- DIN rail mounting:
- 24 V DC power supply
- Supports the GSM services CSD *), SMS and GPRS
- Use with SINAUT MICRO:
  Data transmission via GPRS; switchable to CSD for remote maintenance (incoming call only)
- Use with SINAUT ST7:
  Data transmission via CSD, transmission of SMS

*) CSD – **C**ircuit **S**witched **D**ata (data transmission via GSM dialup connection)

Note:

SIPLUS extreme products are based on Siemens Industry standard products. The contents listed here were taken from the respective standard products. SIPLUS extreme-specific information was added.

SIPLUS MD702-3 GSM / GPRS modem	
Order No.	**6AG1 720-3AA00-7AA0**
Order No. based on	**6NH9 720-3AA00**
Ambient temperature range	-25 ... +70 °C
Conformal coating	Coating of the printed circuit boards and the electronic components
Technical data	The technical data of the standard product applies except for the ambient conditions.
Ambient conditions	
Relative humidity	5 ... 100 % Condensation permissible
Biologically active substances	Conformity with EN 60721-3-3, Class 3B2 mold and fungal spores (except fauna)
Chemically active substances	Conformity with EN 60721-3-3, Class 3C4 incl. salt mist and ISA–S71.04 severity level G1; G2; G3; GX [1] [2]
Mechanically active substances	Conformity with EN 60721-3-3, Class 3S4 including conductive sand, dust [2]
Air pressure (depending on the highest positive temperature range specified)	1080 ... 795 hPa (-1000 ... +2000 m) see ambient temperature range
	795 ... 658 hPa (+2000 ... +3500 m) derating 10 K
	658 ... 540 hPa (+3500 ... +5000 m) derating 20 K

[1] ISA-S71.04 severity level GX: Long-term load: $SO_2 < 4.8$ ppm; $H_2S < 9.9$ ppm; $Cl < 0.2$ ppm; $HCl < 0.66$ ppm; $HF < 0.12$ ppm; $NH < 49$ ppm; $O_3 < 0.1$ ppm; $NOX < 5.2$ ppm
Limit value (max. 30 min/d): $SO_2 < 17.8$ ppm; $H_2S < 49.7$ ppm; $Cl < 1.0$ ppm; $HCl < 3.3$ ppm; $HF < 2.4$ ppm; $NH < 247$ ppm; $O_3 < 1.0$ ppm; $NOX < 10.4$ ppm

[2] The supplied plug covers must remain in place over the unused interface when operated in atmospheres containing corrosive gases!

GPRS modem for IP-based data transmission over GSM networks, quad-band, AT command interface, automatic establishment of GPRS connection, switchable to CSD operation, RS232; manual on CD-ROM in German, English, Chinese, Russian	
Accessories	see Ordering data for MD720-3 GSM/GPRS Modem

Overview

Example configuration for TeleControl Professional with SINAUT ST7

TeleControl Professional is a telecontrol system based on SIMATIC S7 (S7-300, S7-400, and WinCC/PCS 7) for fully-automatic monitoring and control of process terminals which exchange data with one or more control centers or with each other via a wide range of WAN media.

TeleControl Professional facilitates an integrated communications concept (TIA) and complete integration into the SIMATIC environment. The modular design and the support of a huge variety of network forms and operating modes including IP-based networks permit the design of flexible network structures that can also contain redundant links.

By using all forms of transmission media (e.g. dedicated line, wireless, dial-up networks, mobile wireless, DSL), the networks can be optimally adapted to the respective local conditions.

The SINAUT ST7 engineering software and STEP 7 permit simple and cost-effective configuration even of highly complex networks and their extensions.

The system also supports data exchange with devices of the previous system SINAUT ST1 (based on SIMATIC S5).

9

Industrial Remote Communication
TeleControl Professional

Benefits

g get   Designed for Industry

- All conventional and IP-based WAN media can be combined as required, including path redundancy
- Event-driven data transmission incl. time-stamping
- Local data storage
- Remote programming and remote diagnostics
- Integrated operator control and monitoring concept for WinCC/PCS7 or connection to non-Siemens systems via OPC

Application

The TeleControl Professional system has proven itself in the smallest plants with only a few process stations, but also in complex networks with many hundreds of stations.

Examples of the range of uses:

- Safe supply of drinking water, gas or district heating for private and industrial consumers via branched networks
- Economical transportation of gas, oil or oil products through pipelines
- Reliable recording and transmission of process data from environmental monitoring systems
- Remote monitoring of wastewater systems
- Control of beacons, unit-type district heating power stations, conveyor systems or transportation systems

Design

The TeleControl Professional system is based on the SIMATIC systems S7-300 and S7-400 as well as on WinCC/PCS 7. It supplements these systems with the special SINAUT components listed below, comprising hardware as well as software.

Hardware Components

- TIM communication modules
- MD modem modules
- Mobile wireless components (GSM/GPRS/UMTS)
- Dedicated line accessories (overvoltage protection)
- Connecting cables

Software components

SINAUT ST7 Engineering Software

- SINAUT TD7 library;
  contains blocks for the SIMATIC S7 CPU
- SINAUT ST7 configuring and diagnostics software for the programming device

Software for the central control center

- SINAUT ST7cc;
  the SINAUT add-on for WinCC
- WinCC TeleControl;
  add-on for SIMATIC WinCC for telecontrol applications
- PCS 7 TeleControl;
  add-on for SIMATIC PCS 7 for telecontrol applications
- SINAUT ST7sc;
  software for interfacing ST7 with control centers that can operate as OPC clients

Function

Network configurations and operating modes

The telecontrol components support the set-up of complete hierarchical communication networks comprising terminals, node stations and control center.

For the exchange of information between the individual devices, conventional WANs can be used, such as dedicated-line, wireless and dialup networks as well as IP-based WANs such as DSL, GPRS, UMTS, Internet, etc.

There are no restrictions on the combination of WAN types in a project. Point-to-point, line and node network topologies can be set up. Hybrid configurations of these basic structures are also possible.

A station can be linked using two transmission paths to permit redundant data transmission. The two paths can be of the same type or different, e.g. dedicated line plus GPRS, or ISDN plus wireless.

The following network topologies are possible with SINAUT ST7 in the WAN:

- "Point-to-point"
- "Line"
- "Star"
- "Tree"
- "Ring"

The graphics below show examples of different network topologies that can be implemented with SINAUT ST7.

SINAUT ST7cc/sc control station with redundant WAN connection

■ **Function** (continued)

Different communication media in a SINAUT ST7 system

The control center

A number of different versions can be selected as components of the central control center:

SINAUT ST7cc;
PC control center based on WinCC;
this is the ideal control center system for both SINAUT ST7 and SINAUT ST1. It has been designed specifically for event-driven and time-stamped data transmission on the SINAUT system and can be set up as a non-redundant or redundant system (to supplement the WinCC/PCS 7 redundancy package).

PCS 7 with PCS 7 TeleControl;
this is the ideal control center system for plants in which larger local automation tasks have to be combined with telecontrol connections. In addition to SINAUT ST7, remote stations with other communication protocols can be connected, e.g. over DNP3 or IEC -870-5-101/-104. [1]

WinCC TeleControl;
control center system for plants with the WinCC HMI software, expanded with telecontrol connections. WinCC TeleControl offer connection of SIMATIC substations with TIM 3V-IE DNP3, TIM 4R-IE DNP3 or non-Siemens stations with DNP3 protocol, as well as telecontrol stations with IEC 870-5-101/-104.

SINAUT ST7sc;
OPC server for interfacing control centers from other vendors via the OPC Client function;
the SINAUT telecontrol technology can also be connected to control center systems from other vendors via the "Data Access Interface". ST7sc features extensive buffer mechanisms which prevent data from being lost even if the OPC client fails. It can be connected to non-redundant or redundant clients.

Like the substations, the control center comprises a SIMATIC S7-300 or S7-400 PLC.
This solution is suitable for simpler control centers in which only an up-to-date process image of the process data available in the stations is required. The station process control can be influenced by entering commands, setpoints or parameters.
This S7-300 or S7-400 control center can also be used to extend a PC control center (SINAUT ST7cc or ST7sc), e.g. for data output on a panel and/or as an emergency operating system.

[1] More information see catalog ST PCS 7.1

Industrial Remote Communication
TeleControl Professional

■ **Design** (continued)

SINAUT ST7cc control center system with connected ST7 and ST1 stations

Classic WANs

The following conventional WANs can be used for data transmission:

- Copper dedicated lines, private or leased
- Private wireless networks (optionally with time slot procedure)/TETRA
- Dial-up networks (analog/ISDN/GSM)

IP-based WANs

SINAUT communication, however, is also possible via IP-based networks:

- Wirelessly, by using special wireless systems optimized for Ethernet, e.g. the components of the SCALANCE W IWLAN system
- Via fiber-optic conductors, e.g. through use of SCALANCE X switches with optical ports; distances of up to 120 km can then be covered
- Via public networks and the Internet using DSL or GPRS/UMTS.

Change-driven data transmission

In the stations, the SINAUT software ensures that process data is transmitted between CPU and control center, e.g. ST7cc, and from CPU to CPU in the event of changes. Connection, CPU or control desk failures are displayed. A data update for all participating communication partners is performed automatically following debugging or startup of a CPU or of the control center.

Permanently correct time

To enable subsequent and correct archiving of process data in the control system, all data frames are already assigned a time tag at their place of origin. The entire network is synchronized automatically – including daylight saving time changeover.

Local data storage

A special property of the TIM communications module used in the SINAUT ST7 system is the capability for saving data which must not be lost in the event of a connection fault or if the partner fails. A memory capacity is provided for up to 56,000 message frames.

The memory capacity helps to save money on dial-up networks. Various priorities can be assigned to the data to be transmitted. At high priority, a dial-up connection is established immediately. At low priority, data is initially saved in the TIM. This data is transmitted on the next connection that is made with the partner for any reason, for example if an item of information with a high priority is to be transmitted, or if the partner sets up a connection in order to exchange data.

It is precisely because the TIM module can save data and transmit it at a later point in time with a time stamp that the use of a suitable control center system must be ensured. It must also be possible to continue to process this data, specifically as regards subsequent archiving, if the data is received in the control center delayed by a number of hours or even days. Also archive compressions such as the creation of mean, hourly and daily values cannot be performed until all data for the relevant period has been received. The standard SINAUT control center on the basis of WinCC, when supplemented with the SINAUT software ST7cc, is ideal for this task.

SINAUT remote programming and remote diagnostics

In industries in which SINAUT is used, the terminals are distributed across wide areas and are often situated in locations that are difficult to access. Faults which require a visit to be made to a terminal of this type are associated with long journeys. SINAUT ST7 can provide the ideal solution for such circumstances: Remote programming and diagnostics via the telecontrol network. All diagnostics and programming functions provided by SIMATIC and SINAUT for station automation and WAN communication can be used via the telecontrol path - without interrupting process data transmission.

Alarm messaging via text message

In order to alert standby service personnel, event-driven text messages can be sent to mobile phones from the CPUs. An acknowledgment that a message of this type has been received can be sent back to the sender CPU from the mobile phone. A text message can also be output as e-mail, fax or voice mail if the mobile service provider offers these options.

■ Integration

Protocols

SINAUT ST1 protocol

This protocol is used in the SINAUT ST1 system, which is based on the SIMATIC S5 system. However, the SINAUT ST7 system also supports this protocol. Existing SINAUT ST1 systems can be further expanded with the SINAUT ST7 system, or existing system components can be replaced with ST7 devices.

Possible operating modes:

• Polling

• Polling with time slot procedure

• Spontaneous operation (for dialup networks)

Please note that only modems/transmission devices suitable for 11-bit asynchronous characters may be used in both polling modes. However, "spontaneous" mode supports transmission with both 11-bit and 10-bit asynchronous characters.

SINAUT ST7 protocol

This protocol is a more advanced version of the ST1 protocol. It enables SINAUT communication via both conventional and IP-based WANs. In addition, the addressing options have been extended:

• Up to 10,000 stations can be addressed
(maximum of 254 for ST1)

• Message frames contain a source <u>and</u> a target address, (ST1 message frames only contain a source <u>or</u> a target address).

The ST7 protocol also supports "PG routing", i.e. remote programming and remote diagnostics via the WAN <u>without</u> interrupting SINAUT data traffic. PG routing and data traffic share the available bandwidth on the transmission path; PG routing is simply allocated a higher priority.

Possible operating mode in the IP-based WAN:

• Spontaneous mode

Possible operating modes in the conventional WAN:

• Polling

• Polling with time-slot procedure

• Spontaneous operation (for dialup networks)

Modes

Polling

• In polling mode, data exchange is controlled from the controller. It calls the connected terminals (including node terminals) in sequence. Terminals with modified data send this data as soon as they are called. Terminals with no modified data at the present time simply acknowledge the call. Data from the CPU to the terminals can be transferred at any time between the individual calls.
The ST7 protocol supports direct data transmission between substations. During this type of communication, data is always exchanged via the polling control center TIM.

Polling with time-slot procedure

This mode is used on a radio network on which the use of the radio frequency assigned by the registration authorities has to be shared with other operators. Typically, each operator has 6 seconds per minute to exchange data with its terminals. Once this time has elapsed, the frequency must be enabled for the next operator. During the allocated time slot, this type of polling operates in the same way as standard polling.

The ST7 protocol supports direct data transmission between substations. During this type of communication, data is always exchanged via the polling control center TIM.

In order to exactly observe the time slot, the polling control center TIM must be directly supplied with the DCF77 or GPS time.

Spontaneous mode

Spontaneous mode for data exchange on dial-up networks: Different priorities (normal, high or interrupt) can be assigned to the data of the station or node station for transmission in the dial-up network. Data to be sent by the control center always have the high priority. If data with a high or alarm priority is awaiting transmission, a dial-up connection is established immediately. At normal priority, data is initially saved in the terminals. This data is transmitted on the next connection that is made with the partner for any reason, for example if an item of information with a high or alarm priority is to be transmitted, or if the partner sets up a connection in order to exchange data.

The message frames saved in the TIM are transmitted according to the FIFO principle, i.e. in the original chronological sequence, providing they are message frames with high or normal priority. If alarm message frames are present in the TIM buffer, these are always transmitted before the other message frames.

Direct data transmission between substations is is possible with the ST7 protocol.

Industrial Remote Communication
TeleControl Professional

■ Integration (continued)

Spontaneous operation in the IP-based WAN

For transmission via an IP-based network, a permanent S7 connection is established in each case between two TIMs or between one TIM and the ST7cc/ST7sc. The two TIMs or the TIM and ST7cc/ST7sc exchange the data packages specific to SINAUT ST7 with application of the TCP/IP transport protocol. The transmission is performed with the resources of the S7 communication, in which the processing of the spontaneous data exchange depends on whether the transmitted volume of data is chargeable or not in the IP-based network.

Networks without volume tariff:
When data is transmitted, it is transferred immediately to the respective partner regardless of any priority.
Data is transferred in accordance with the FIFO principle. This does not apply to message frames with "interrupt" priority. These are transferred before any other message frames that are available in the buffer.

Networks with volume tariff:
In an IP-based network such as the GPRS network, the priority of the individual data frames (normal, high or interrupt) is taken into consideration, as in the case of a dialup network. Data with normal priority is collected and transmitted in larger blocks, as soon as a specific size of block is achieved or, at the latest, when the specified TCP/IP Keep-alive interval has expired. This saves transmission volume because a reduced message frame overhead and fewer acknowledgment message frames are required. Important data with high or interrupt priority is transmitted immediately. Normal message frames that are buffered at this point are sent at the same time. Message frames with normal or high priority are transmitted in accordance with the FIFO principle.

Network configurations and topologies

All networks and all transmission media can be combined in any way in a telecontrol project – both with each other in "node structures", as well as in parallel in star topologies or in redundant configurations.

The graphics below show a selection of different topologies that can be implemented with the telecontrol components.

Basic topologies

Differently structured telecontrol networks can be implemented in the wide area network (WAN) based on the following four basic topologies.

Media versions

Depending on the support provided by the selected telecontrol protocol, various transmission media are available for these basic topologies, e.g. dedicated line, private wireless networks, mobile radio networks, dial-up networks (wireless/landline), DSL over Internet.

Some of these media versions are shown in the example of the star topology.

Combinations of basic topologies and media versions

Through a combination of several basic topologies of the same or different media versions, it is additionally possible to design more complex network topologies, even with redundant communication paths. This allows optimum adaptation to process requirements and to the existing infrastructure.

Overview

Design principle of a telecontrol system and plants with SIMATIC

Telecontrol involves the connection of distant process stations to one or more central control systems. A telecontrol system can be subdivided into the following components:

- Control center
- Communication network
- Substations

Various different public or private networks can be used for communication for the purposes of monitoring and control. The event-controlled or cyclic exchange of the process data takes place via special telecontrol protocols such as SINAUT ST1, SINAUT ST7, DNP3 or IEC 870-5-101/-104.

The control center

A number of different versions can be selected as components of the central control center:

SINAUT ST7cc;
PC control center based on WinCC;
this is the ideal control center system for both SINAUT ST7 and SINAUT ST1. It has been designed specifically for event-driven and time-stamped data transmission on the SINAUT system and can be set up as a non-redundant or redundant system (to supplement the WinCC redundancy package).

Industrial Remote Communication
TeleControl Professional for the control center

Overview (continued)

PCS 7 with PCS 7 TeleControl;
this is the ideal control center system for plants in which larger local automation tasks have to be combined with telecontrol connections. In addition to SINAUT ST7, remote stations with other communication protocols can be connected, e.g. over DNP3 or IEC 870-5-101/-104.

WinCC TeleControl;
control center system for plants with the WinCC HMI software, expanded with telecontrol connections. WinCC TeleControl offer connection of SIMATIC substations with TIM 3V-IE DNP3, TIM 4R-IE DNP3 or non-Siemens stations with DNP3 protocol, as well as telecontrol stations with IEC 870-5-101/-104.

SINAUT ST7sc;
OPC server for interfacing control centers from other vendors via the OPC Client function;
the SINAUT telecontrol technology can also be connected to control center systems from other vendors via the "Data Access Interface". ST7sc features extensive buffer mechanisms which prevent data from being lost even if the OPC client fails. It can be connected to non-redundant or redundant clients.

SIMATIC S7 PLC as control center

Like the substations, the control center comprises a SIMATIC S7-300 or S7-400 PLC. This solution is suitable for simpler control centers in which only an up-to-date process image of the process data available in the stations is required. The station process control can be influenced by entering commands, setpoints or parameters. This S7-300 or S7-400 control center can also be used to extend a PC control center (SINAUT ST7cc or ST7sc), e.g. for data output on a panel and/or as an emergency operating system.

Application

The SINAUT ST7 engineering software with the following components is required for configuring, diagnosing and operating a telecontrol system with the ST7 or DNP3 protocol:

- SINAUT ST7 configuration and diagnostics software
- SINAUT TD7 Library

The software package is a work package which can be used for any number of SINAUT projects without a licensing process.

Apart from ST1 and ST7 connections, the SINAUT ST7 engineering software Version V5.1 or higher also supports the DNP3-compliant TIM modules TIM 3V-IE DNP3 and TIM 4R-IE DNP3.

Function

SINAUT ST7 configuration and diagnostics software for STEP 7

- Executable under Windows XP, Vista or Server 2003; STEP 7 software V5.4 SP4 or higher must also be installed.
- Includes:
  - Module manager to supplement the HW Config STEP 7 tool; it displays and sets the parameters of the TIM modules in HW Config.
  - WAN Manager to supplement the NetPro STEP 7 tool; it displays and sets the parameters of the SINAUT WAN networks and network nodes in NetPro
  - The SINAUT ST7 configuration software is used for project-wide functions such as SINAUT connection configuration and SINAUT station management
  - SINAUT ST7 diagnostics and service tool; in addition to the diagnostics functions familiar to users of STEP 7, it also provides access to SINAUT-specific diagnostic information. The service tool can be used, for example, to upload new software to the TIM.

Module manager for SINAUT systems

A SINAUT ST7 folder is added to the SIMATIC 300 directory. This folder contains a list of all available TIM modules. The TIM module required in each case can be selected from this directory and installed in the S7 rack. A corresponding Properties dialog box can be called up to set the module parameters.

WAN Manager for SINAUT systems

In the catalog for the STEP 7 network configuration tool NetPro, the SINAUT "dedicated line" and "dial-up" networks are added to the "Subnets" directory. The SINAUT networks required in each case can be selected from this directory and installed in the NetPro window. With the SINAUT ST7 engineering software V5.0 and higher, the MSC-VPN tunnel protocol can also be used under the "Industrial Ethernet" network type for configuring the SINAUT data transmission via the Internet and GPRS.

The TIM modules can be assigned to these networks using the mouse or dialog boxes. Any erroneous connections are rejected immediately.

A corresponding Properties dialog box is called up to define the generally valid parameters for a network, e.g. ST7 or DNP3 protocol, transmission rate, etc.

The individual properties for each of the network nodes can be defined in a further dialog box, e.g. the dedicated telephone number for the connection to a dialup network.

If necessary, the Properties dialog box for a TIM module can be opened in NetPro with the same property options as in HW Config.

9

SINAUT ST7 Engineering Software

■ Function (continued)

SINAUT ST7 configuration software

The SINAUT ST7 configuration software is an independent configuration tool for the telecontrol system that can comprise ST1, ST7 or DNP3 modules; it includes:

- Connection configuration
- Station management
- SINAUT ST1 configuration overview

First, the "Connection configuration" tool is used to define the SINAUT stations (ST7 CPU, DNP3, ST7cc, ST7sc or ST1 device) between which a connection is required. For this purpose, the tool displays a list of all connections possible in the right-hand side of a two-section window. The tool has generated the list automatically using the network configured with NetPro (see WAN Manager for SINAUT systems). The user moves the connections actually required from the right-hand to the left-hand window using the pop-up menu.

One of the features provided by the "Station management" tool is a list of all SINAUT devices. If necessary, station-specific modifications can be made, e.g. the SINAUT station numbers can be changed for the individual devices, or message texts can be configured to be sent as text messages. The station management tool also handles configuring of the data frames to be sent and received if frame generation and evaluation are to be carried out by the TIM (only possible for TIMs with TD7onTIM functionality). The tool generates the system data blocks (SDB) for the CPUs and TIMs from the configuration data. If the SINAUT TD7 software is used for the CPU, the tool also preprocesses the accounting and communication data blocks for the CPUs, which it stores in the CPU block library together with the blocks (FBs, FCs) which are essential to the CPUs for SINAUT communication.

The third tool, "SINAUT ST1 – Configuration overview" is only required for configuring systems which also feature SINAUT ST1 devices. This tool makes adjusting the addresses for SINAUT ST1 much easier.

SINAUT ST7 diagnostics and service tool

In addition to the diagnostics functions familiar to users of STEP 7, the SINAUT ST7 diagnostics and service tool also provides access to SINAUT-specific diagnostic information. The service tool can be used, for example, to upload new software to the TIM.

SINAUT TD7 library, blocks for the CPU

The SINAUT TD7 library is a software package with blocks for the CPU (TD7onCPU), in which TD7onCPU can be used for ST1 and ST7 systems, but not for DNP3 systems. The package has been designed so that it can run both on an S7-400 and on an S7-300 CPU. Only a small number of blocks have been designed specifically for the S7-300 or S7-400 CPU respectively.

In the stations, the SINAUT TD7 software ensures that process data is transmitted between CPU and control console, e.g. ST7cc, and from CPU to CPU in the event of changes. Connection, CPU or control desk failures are displayed. A data update for all participating communication partners is performed automatically following debugging or startup of a CPU or of the control desk. A time stamp can be assigned to data message frames if required.

The package essentially comprises:

Basic and auxiliary blocks
Most of these blocks are always required in the CPU, a small number are optional. The basic blocks handle central tasks such as startup, monitoring of connections and connection partners, general requests, time management, handling communication etc. The auxiliary blocks enter data frames, for example, in the send buffer or fetch them from the receive buffer, handle send and receive jobs for specific connections, or provide information as a result of searches.

Data-point typicals
These blocks are integrated into the CPU program on the basis of the data types and data volumes to be transmitted. In the event of changes to data, they create message frames or output received process data.

In order to operate correctly, the TD7onCPU package needs a number of data blocks which are generated by the SINAUT ST7 engineering software. These are:

Central accounting DB
This block contains all data required centrally, e.g. accounting data for all communication partners as well as for all connections to be managed.

Communication DBs
A separate communication DB is created for every connection with a sending and receive mailbox and all data required for controlling and monitoring this connection.

SINAUT ST7cc, Add-on for WinCC

Overview

SINAUT ST7cc control center system (non-redundant or redundant) with connected ST7 and ST1 terminals

Based on SIMATIC WinCC, SINAUT ST7cc is the ideal control center system for both SINAUT ST7 and SINAUT ST1. It has been developed specifically for event-driven and time-stamped data transmission on the SINAUT telecontrol system.

A fault-tolerant ST7cc control center can be set up in conjunction with the WinCC redundancy package.

SINAUT ST7cc additionally assumes the function of a telecontrol center. There is therefore no need for a separate SIMATIC S7-CPU for this function.

Benefits

get Designed for Industry

- Interfacing of SIMATIC S7 substations to SIMATIC WinCC via conventional and IP-based telecommunications network
- Entry of messages, analog and count values in WinCC archive using the event times supplied by the substations
- Protection of investments in existing SINAUT ST1 systems, as ST1 stations can be connected
- Saving of time and reduction of costs through simple configuration without requiring detailed knowledge of SINAUT

Application

Based on SIMATIC WinCC, SINAUT ST7cc is the ideal control center system for both SINAUT ST7 and SINAUT ST1.

It has been developed specifically for event-driven and time-stamped data transmission on the telecontrol system. It avoids the possible loss of data inherent during cyclic polling in WinCC. It also ensures the use of the correct event times supplied by the substations for all messages and archive entries. The process image integrated into ST7cc contains all process data along with the status of all SINAUT stations in the network, and makes this data available directly to WinCC for high-speed process image visualization.

ST7ccConfig provides the user with an integrated configuring tool based on the data telegrams configured in the SINAUT ST7 or ST1 terminals. The WinCC tags are configured automatically and updated consistently to reflect any changes.

The additional use of the WinCC add-on ACRON is recommended for archives, protocols and reports in accordance with ATV Notice H260 or Hirthammer.

The Alarm Control Center software package is useful for alerting service personnel via text message, fax, e-mail or voice mail and is also available as a WinCC add-on.

A fault-tolerant ST7cc control center can be set up in conjunction with the WinCC redundancy package.

Design

SINAUT ST7cc is installed on a Windows PC. WinCC can also run on the same PC. However, client/server configurations are also possible, in which the ST7cc is located on the WinCC server.

The following software packages and licenses are required for an ST7cc control center that is configured as a single-channel or redundant system with WinCC. A license for the WinCC complete package is required. A runtime package may be sufficient if no configurations are required on the end computer. The WinCC redundancy package incl. license is also required for the redundant ST7cc.

The table below lists the software packages required for the ST7cc non-redundant/redundant system in detail.

ST7cc non-redundant system		ST7cc redundant system	
Number	Software package	Number	Software package
1	WinCC complete package [1]	1	WinCC complete package [1]
–	–	1	WinCC runtime package
–	–	1	WinCC redundancy package (with 2 licenses)
1	SIMATIC NET SOFTNET for IE license for CP software	2	SIMATIC NET SOFTNET for IE license for CP software
–	–	1	ST7cc redundancy package (with 2 licenses)
1	SW ST7cc S (with license for 6 stations) or SW ST7cc M (with license for 12 stations) or SW ST7cc L (with license for > 12 stations)	2	SW ST7cc S (with license for 6 stations) or SW ST7cc M (with license for 12 stations) or SW ST7cc L (with license for > 12 stations)

[1] A runtime package may be sufficient if no configurations are required on the end computer.

One or several SINAUT ST7 TIM communications processors are connected to the ST7cc PC depending on the TIM type used either via the MPI bus or via Ethernet. Both ST7 and ST1 terminals can be connected to the TIMs, only ST7 terminals to the TIMs on the Ethernet.

Provision of current time of day:

- Time synchronization for TIMs connected via MPI to the ST7cc PC is only possible using a TIM equipped with a DCF77 receiver. This is then responsible for central synchronization of the ST7cc PC and all terminals.
- Time synchronization for TIMs connected via Ethernet to the ST7cc PC is via ST7cc.

Outside the reception area of the DCF77 real-time transmitter the use of a GPS receiver is recommended. This determines the local time from the satellite-based global positioning system (GPS).

Function

Functioning as a remote control center with convenient diagnostic functions

- Direct connection of SINAUT ST7 TIMs over MPI and Ethernet to ST7cc. A separate series-connected S7-300 or S7-400 controller is not required as a central remote control center.
- Provision of the most important status information for each SINAUT ST7 or ST1 station with visualization in WinCC using supplied station typicals (display typicals and faceplates).
- Control possibilities for the SINAUT stations over these faceplates.
- Tagging the process values from stations with an interrupted connection to ST7cc.
- General scanning of affected stations following the end of a transmission fault for updating the process image in ST7cc.
- For diagnostic purposes: Selective activation of recording of the message traffic for individual or all SINAUT stations. Message frame visualization and evaluation is performed in the same manner as by the TIM message frame monitor.
- Time synchronization by ST7cc for the TIMs that are connected to the ST7cc PC over Ethernet.

Preprocessing of process data

Preprocessing can be configured for binary values, analog values, and count values. They take into account the event time points and tag derived alarms and archive entries with correct time stamps.

- **Binary values**
  - Entry of current binary values into the assigned WinCC tags taking into account the time stamps supplied by SINAUT ST7 or ST1.
- **Analog values** (current and average values)
  - Floating-point numbers, integer values
  - Linear raw value conversion (raw value $\rightarrow$ physical value)
  - Entry of analog values (with or without linear raw value adaptation) in the associated WinCC tags
  - Entry of analog values (with or without linear raw value adaptation) into the WinCC archive taking into account the time stamps supplied by SINAUT ST7 or ST1.
- **Count values**
  - Overflow handling in the case of absolute counters.
  - Count value conversion using factors.
  - Generation of correct interval times.
  - Entry of currently accumulating interval quantities in the assigned WinCC tags.
  - Entry of complete interval quantities into the WinCC archive taking into account the time stamps supplied by SINAUT ST7 or ST1.
- **Setpoints**
  - Floating-point numbers, integer values
  - Linear raw value conversion (physical value $\rightarrow$ raw value) if required.

Simple, integrated configuration

Configuration of the overall system with ST7ccConfig is very user friendly. A separate WinCC configuration for tag management, archive and alarm system is limited to a few preparatory measures, such as the creation of archives and, in the case of WinCC, the definition of alarm classes and types.

Industrial Remote Communication
TeleControl Professional for the control center

WinCC/TeleControl

Overview

WinCC/TeleControl for WinCC V7.0 SP2 supports connection to outlying stations (Remote Terminal Units = RTUs) via telecontrol protocols.

Benefits

WinCC/TeleControl for WinCC V7.0 SP2 cannot only integrate newly configured RTUs, it can also integrate units which already exist in outlying areas by means of DNP3 or IEC 870-5-101/104 drivers.

For communication with the outstations, WinCC/TeleControl for WinCC V7.0 SP2 uses the SINAUT ST7 and DNP3 protocols (both via serial and TCP/IP communication connections) as well as IEC 870-5-101 (serial) and IEC 870-5-104 (Ethernet TCP/IP).

The serial RTU link is possible via the following components, which can be connected directly via WinCC (single station or server):

- SINAUT TIM communication modules
  (SINAUT ST7 telecontrol protocol)
- TCP/IP serial converter (telecontrol protocols DNP3, Modbus (not released for WinCC TC), IEC 870-5-101)

Equipment from MOXA or Lantronix, for example, can be used as TCP/IP serial converters.

By means of Ethernet TCP/IP, the RTUs can be connected directly or via TCP/IP WAN routers to the SIMATIC WinCC system bus (SINAUT ST7, DNP3, IEC 870-5-104 telecontrol protocols). When using the SINAUT ST7 telecontrol protocol, the SINAUT TIM communication module can be used in addition to the TCP/IP WAN router or as an alternative.

Integration

Integration of WinCC/ TeleControl for WinCC V7.0 SP2 into the WinCC SCADA system offers particular advantages for the water and waste water sectors, as well as oil and gas sectors, especially in the case of the following types of plant:

- Freshwater treatment and distribution
- Wastewater treatment plants
- Oil and gas pipelines and water pipes
- Oil and gas drilling fields and the associated treatment plants

In these types of plant, remote outstations such as pumping stations, valve stations or automated stations for wellheads must be integrated.

Through the support of communication protocols for RTUs such as SINAUT ST7, WinCC/ TeleControl for WinCC V7.0 SP2 supports the following advanced communication concepts:

- Reduction in the transferred data volume by means of event-controlled communication mechanisms for alarm and measured value information.
- Time-synchronization of RTUs and correct time stamping of all data in the RTU.
- Tolerance of lower bandwidth, high latency or lack of reliability of communication lines
- Prevention of data loss due to communications failure through data backup in the RTU
- Support of communication media with serial interface (dedicated lines, dial-up connections over analog telephone lines and ISDN lines), various radio devices (standard, spread spectrum modulation), microwave and GSM
- Support for TCP/IP-based WANs (Wide Area Networks) such as DSL, GPRS or Ethernet radio networks
- Support for redundant communication connections
- Expanded communication diagnostics functions for RTU communication links
- Remote programming of RTUs
- Support for different communication topologies – Point-to-point, multidrop (multistation mode) and hierarchic network structures
- High quality server redundancy scheme without data loss in the case of server failure

Through the support of communication protocols for RTUs such as IEC 60870-5 and DNP3, SIMATIC TeleControl for WinCC V7.0 SP2 supports the following advanced communication concepts:

- Reduction in the transferred data volume by means of event-controlled communication mechanisms for alarm and measured value information.
- Time-synchronization of RTUs and correct time stamping of all data in the RTU.
- Tolerance of lower bandwidth, high latency or lack of reliability of communication lines
- Prevention of data loss due to communications failure through data backup in the RTU (not all non-Siemens RTUs support this)
- Support of communication media with serial interface (dedicated lines, dial-up connections over analog telephone lines and ISDN lines), various radio devices (standard, spread spectrum modulation), microwave and GSM
- Support for TCP/IP-based WANs (Wide Area Networks) such as DSL, GPRS or Ethernet radio networks
- Support for redundant communication connections
- Expanded communication diagnostics functions for RTU communication links
- Remote programming of RTUs
- Support for different communication topologies – Point-to-point, multidrop (multistation mode) and hierarchic network structures
- High quality server redundancy scheme without data loss in the case of server failure

9

■ Integration (continued)

Outstations/remote terminal units

WinCC/ TeleControl for WinCC V7.0 SP2 supports the following preferred outstations for local distributed automation:

- Controller integrated into ET 200S (IEC 870-5-101/104 telecontrol protocols); for cost-sensitive applications, up to approx. 30 I/O signals or approx. 200 data points
- S7-300/S7-300F controller (SINAUT ST7, DNP3, IEC 870-5-101/104 telecontrol protocols); for extremely flexible configuration, up to 100 I/O signals or approx. 2000 data points

- S7-400/S7-400F controller (SINAUT ST7, DNP3, IEC 870-5-101/104 telecontrol protocols); up to 500 I/O signals or approx. 5000 data points
- S7-400/S7-400F redundant controller (IEC 870-5-101/104 and DNP3 telecontrol protocols); up to 500 I/O signals or approx. 5000 data points
- Third-party station with the IEC 870-5-101/104 and DNP3 telecontrol protocols (depending on type of station)

The following table provides an overview of the current options for connecting to these outstations:

Spectrum of outstations and integration versions

Overview

PCS 7 Add-on | fit for SIMATIC PCS 7 V7

Integration and communication options with SIMATIC PCS 7 TeleControl V7.1

Plants are often scattered over very large grounds in the energy and transportation industries, and especially in the water & wastewater and oil & gas industries. In such cases it is necessary to integrate outstations for monitoring and controlling highly remote plant units (usually with a small or medium degree of automation) into the control system of the complete plant. This is carried out by means of telecontrol protocols over a WAN (Wide Area Network).

Conventional automation solutions for telecontrol systems use process control systems for the more complex central areas of the plant, and simpler Remote Terminal Units (RTUs) for the outstations, and then combine these separately configured plant units in a host network control system.

Direct integration of the telecontrol center

However, it is far more efficient if the telecontrol center for the RTUs is directly integrated into the process control system. The network control system as the superimposed integration level can then be omitted.

The SIMATIC PCS 7 TeleControl V7.1 products are suitable for integration of the telecontrol center into the process control and engineering of the SIMATIC PCS 7 V7.1 process control system. They support the RTU linking in different manners (see graphic "Integration and communication options with SIMATIC PCS 7 TeleControl V7.1" and table "Current connection possibilities for widely distributed telecontrol outstations").

Industrial Remote Communication
TeleControl Professional for the control center

SIMATIC PCS 7 TeleControl

■ Overview (continued)

As far as the scope and performance of the automation functions are concerned, the requirements of the widely distributed plant sections are usually in the bottom to mid range, which means you can use automation stations of reduced dimensions for the outstations. SIMATIC PCS 7 TeleControl V7.1 particularly supports the following outstations for distributed automation on site:

RTU category	RTU type [1]	Possible telecontrol protocols
Small with up to approx. 30 I/Os For small, cost-sensitive applications	Controller integrated in SIMATIC ET 200S	Modbus, IEC 870-5-101, IEC 870-5-104
Medium with up to approx. 100 I/Os For medium sized applications	SIMATIC S7-300/ S7-300F controller	SINAUT ST7, DNP3, Modbus, IEC 870-5-101, IEC 870-5-104
Large with up to approx. 500 I/Os For larger applications requiring higher performance	SIMATIC S7-400/ S7-400F controller	SINAUT ST7, DNP3, Modbus, IEC 870-5-101, IEC 870-5-104
	SIMATIC S7-400H/ S7-400FH controller	DNP3, IEC 870-5-101, IEC 870-5-104

[1] Also in version "SIPLUS extreme", e.g. for environments with temperature from -25 °C to +70 °C, condensation, or medial exposure

Note:

You can find more information in Catalog ST PCS 7.1 and in the Industry Mall at www.siemens.com/industrymall.

■ Benefits

- SIMATIC PCS 7 TeleControl V7.1 cannot only integrate newly configured RTUs into SIMATIC PCS 7 V7.1, but also migrate units which already exist in outdoor areas.

- As a result of its high level of integration, automation based on SIMATIC PCS 7 TeleControl V7.1 offers decisive advantages compared to previous automation solutions with telecontrol engineering.
  - The uniform SIMATIC PCS 7 V7.1 software platform allows high efficiency during operation, and results in low costs for training, configuration and servicing.
  - The homogenous GUI for local and remote processes simplifies operation and simultaneously reduces the risk of an operator error.

- The Data Base Automation (DBA) software efficiently supports engineering and takes into account the conformity with SIMATIC PCS 7 V7.1.
  - DBA considerably facilitates project-specific adaptation of the system and importing of existing configurations in the course of migration.
  - Extensions can be added during plant operation.

■ Application

Remote control and monitoring of distributed stations, as well as data recording and transmission, with the following focal points:

- Water industry
  - Well, pumping and slide valve stations in water supply networks and irrigation plants
  - Pumping and slide valve stations in water and wastewater pipelines
  - Storm-water tanks and siphon stations in wastewater networks
  - Storage units (elevated tanks)
- Oil and gas industries
  - Compressor, pressure reduction, transfer, block valve, and metering stations in gas networks
  - Pumping and slide valve stations in oil pipelines
  - Automation on the wellhead of gas and oil wells
  - Stations for the injection of water or CO_2 in gas or oil fields
- Energy management, environmental protection, and transportation
  - Equipment for power generation and distribution
  - District heating
  - Traffic control systems
  - Tunnels
  - Railway stations
  - Lighthouses
  - Environmental monitoring equipment
  - Weather stations

■ Design

The telecontrol center for the outstations (RTUs) is integrated into the process control of the SIMATIC PCS 7 V7.1 process control system in the form of an operator station in single station or server design (also redundant as option). No additional automation system for conditioning and connecting telecontrol-specific data need be planned in the SIMATIC PCS 7 system. With large quantity frameworks, a PCS 7 TeleControl operator station (single station/server) is preferably responsible only for the telecontrol mode (dedicated). With small quantity frameworks, a server or a single station can also control SIMATIC PCS 7 automation systems in central plant areas in addition to the RTUs (dual-channel mode).

To enable engineering of the PCS 7 telecontrol operator station (single station/server), the functions of the engineering station of the SIMATIC PCS 7 V7.1 process control system are expanded by the DBA technology (Data Base Automation) and the SIMATIC PCS 7 TeleControl V7.1 block library.

For communication with the RTUs, SIMATIC PCS 7 TeleControl V7.1 uses the telecontrol protocols SINAUT ST7, DNP3 und Modbus (both via serial and TCP/IP communication connections) as well as IEC 870-5-101 (serial) and IEC 870-5-104 (Ethernet TCP/IP).

With serial RTU interfacing, the telecontrol connection can be implemented cost-effectively at the control center end (PCS 7 TeleControl OS as single station or server) using the following components:

- SINAUT TIM communication modules (SINAUT ST7 telecontrol protocol)
- TCP/IP converter - serial e.g. devices from the company MOXA or Lantronix (DNP3, Modbus, IEC 870-5 101 telecontrol protocols)

By means of Ethernet TCP/IP, the outstations can be connected either directly or via TCP/IP WAN routers to the SIMATIC PCS 7 system bus (SINAUT ST7, DNP3, Modbus, IEC 870-5-104 telecontrol protocols). When using the SINAUT ST7 telecontrol protocol, the SINAUT TIM communication module can be used in addition to the TCP/IP WAN router or as an alternative.

9

■ **Design** (continued)

The following table shows the current connection possibilities depending on the type of RTU and type of communication.

Outstations for integration (RTU)
Current range, communication options and features

[1] Data buffering is limited to two SIMATIC S7 data blocks.
Depending on the SIMATIC CPU, this corresponds to ca. 800 to 3 200 buffered frames.

9

SIMATIC PCS 7 TeleControl

■ Design (continued)

The telecontrol protocols used by SIMATIC PCS 7 TeleControl for remote communication are matched to the conditions of the widely distributed communication infrastructure.

The WAN transmission media suitable for communication between the RTUs and the telecontrol center are diverse, e.g.

- Private networks
  - Wireless
  - Dedicated line
  - WLAN
- Public networks
  - GPRS
  - EGPRS
  - UMTS
  - DSL

Based on the four basic topological forms (point-to-point, multipoint, star and ring), differently structured telecontrol networks can be implemented with these media versions, e.g. star over wireless, dedicated line or DSL. Through a combination of several basic topologies of the same or different media versions, it is also possible to design more complex network topologies, even with redundant communication paths. Optimum adaptation to the local conditions and the infrastructure which may already exist is possible in this manner.

Migration of existing telecontrol systems

SINAUT ST1 stations based on SIMATIC S5

In the course of migration of existing plants, RTUs based on SIMATIC S5 can also be integrated via SIMATIC PCS 7 TeleControl into the process control system. In the process, the ST1 telecontrol protocol is converted into the ST7 protocol in the central TIM communication module.

Units with Modbus communication

SIMATIC PCS 7 TeleControl V7.1 cannot only integrate new RTUs into SIMATIC PCS 7 V7.1, it can also integrate plant sections which already exist outdoors, for example, plant sections which have a Modbus infrastructure. These sections can be integrated into SIMATIC PCS 7 using the Modbus protocol via serial lines or TCP/IP connections.

Whereas RTUs with Modbus TCP/IP interface can be integrated directly, third-party RTUs require special interface converters for telecontrol communication.

Third-party stations with telecontrol protocols

In addition to the Modbus telecontrol protocol, the DNP3 (serial and TCP/IP), IEC 870-5-101 (serial) and IEC 870-5-104 (TCP/IP) telecontrol protocols also support the control center interfacing of third-party RTUs in the course of migration. A prerequisite is that the RTU supports the corresponding protocol and that the required interface converters are available.

Third-party stations with OPC

Third-party RTUs for which an OPC server exists can be integrated into the process control with the PCS 7 TeleControl operator system using additional engineering services on the basis of the DBA technology. SIMATIC PCS 7 TeleControl then supports data exchange between the operator system (OPC client) and the RTU (OPC server) per OPC DA.

SINAUT LSX systems

Existing SINAUT LSX systems can also be migrated with SIMATIC PCS 7 TeleControl V7.1. The SIMATIC S7 controllers with the EDC telecontrol protocol (Event Driven Communication) installed in the SINAUT LSX system are integrated into SIMATIC PCS 7 TeleControl V7.1 per PCS 7 TeleControl S7 EDC drivers (for ordering data, refer to the following catalog section PCS 7 TeleControl operator system). Because the SINAUT LSX system can coexist at all levels next to the new system architecture as long as necessary, step-by-step modernization is possible without short-lived intermediate solutions.

■ More information

Detailed information, ordering data and technical specifications on the individual SIMATIC PCS 7 TeleControl products can be found in the catalog ST PCS 7.1 and on the internet at:

PCS 7 TeleControl Engineering Station

Overview

The PCS 7 TeleControl OS Engineering V7.1 software package is used to configure a SIMATIC PCS 7 industrial workstation of single station or server design as a SIMATIC PCS 7 TeleControl engineering station.

Ordering data

	Order No.
PCS 7 TeleControl OS Engineering V7.1 (unlimited POs) Software package with SIMATIC PCS 7 Engineering Software V7.1 + SP2, unlimited POs (cannot be used as operator station for productive operation)	**6DL5 000-8AF17-0XA5**
Engineering software, 2 languages (German, English), software class A, executes with Windows XP Professional / Server 2003, floating license for 1 user	
Electronic documentation on CD/DVD, 2 languages (German, English)	
Type of delivery:	
• License key memory stick, certificate of license including terms and conditions	
• SIMATIC PCS 7 Software Media Package V7.1 + SP2	
• CD "PCS 7 TeleControl Option V7.1 + SP2"	
PCS 7 TeleControl OS Engineering Component Option V7.1 To upgrade an existing SIMATIC PCS 7 Engineering Station V7.1 + SP2 (unlimited POs) for PCS 7 TeleControl V7.1 + SP2; software package without SIMATIC PCS 7 Engineering Software V7.1 + SP2	**6DL5 000-8AF17-0XE5**
Engineering software, 2 languages (German, English), software class A, executes with Windows XP Professional / Server 2003, floating license for 1 user	
Electronic documentation on CD, 2 languages (German, English)

PCS 7 TeleControl Operator System

■ Overview

Uniform process control for central and remote units

The PCS 7 TeleControl OS software packages V7.1 offered for OS runtime mode are tailored to the architecture of the SIMATIC PCS 7 operator system V7.1. They support single-user systems (single stations) as well as multi-user systems with up to 12 servers/redundant pairs of servers and up to 32 clients.

Industrial Remote Communication
TeleControl Professional for the control center

SINAUT ST7sc SCADA Connect Software

■ Overview

SINAUT ST7sc control center system (non-redundant or redundant) with connected ST7 and ST1 terminals

- The SCADA Connect Software SINAUT ST7sc permits the connection of telecontrol substations with ST7 and ST1 protocol to control center systems that can operate as OPC clients, e.g. iFIX from Intellution, InTouch from Wonderware, Micro SCADA from ABB.
- SINAUT ST7sc is also suitable for data exchange with other applications via OPC, e.g. with the Office application Excel.
- The OPC data can be exchanged either synchronously or asynchronously (change-controlled).
- The "Item Buffering" function prevents the loss of data on failure of the OPC client or if SINAUT terminals supply data at a faster rate than can be transferred via the OPC interface.
- System availability can be increased by connecting two ST7sc systems working in parallel to a redundant client system.
- SINAUT ST7sc additionally assumes the function of a telecontrol center. There is therefore no need for a separate SIMATIC S7-CPU for this function.

■ Benefits

get Designed for Industry

- Connection of SINAUT stations to HMI, SCADA and Office applications via OPC
- The "Item Buffering" procedure ensures seamless archiving
- Time and cost savings through simple configuration without requiring detailed knowledge of SINAUT

■ Application

The TeleControl system allows substations to be networked with a control center via WAN (**W**ide **A**rea **N**etwork) or Industrial Ethernet. This control center can also be a SIMATIC terminal or a PC-based control center, for example, WinCC with the SINAUT ST7cc add-on.

SINAUT ST7sc offers suppliers of other control center systems the option of connecting to substations with SINAUT ST7 without having to integrate a SINAUT interface. Communication is over OPC: As an OPC server, SINAUT ST7sc forms the interface between the telecontrol system and the third-party control system connected as an OPC client.

The OPC interface is also suitable for data exchange with other applications, for example, the Microsoft Office application Excel.

■ Design

SINAUT ST7sc is installed on a Windows PC (Windows 7, Windows 2008 Server). The OPC server function supports connection of one or more client applications. These clients are either connected over a suitable communication medium, e.g. Industrial Ethernet, with the server or they are installed on the same PC as SINAUT ST7sc.

Connection of one or more telecontrol substations to the ST7sc PC is carried out either via the MPI bus or Industrial Ethernet, depending on the TIM communication module used.

Provision of current time of day:
- For TIMs, that are connected over MPI to the ST7sc PC, time synchronization is only possible through a DCF77 receiver equipped with a TIM. This provides central time synchronization for the ST7sc PC and all other stations.
- For TIMs that are connected over Industrial Ethernet to the ST7sc PC, time synchronization is performed over ST7sc.

Outside the reception area of the DCF77 real-time transmitter the use of a GPS receiver is recommended. This determines the local time from the satellite-based global positioning system (GPS).

SINAUT ST7sc SCADA Connect Software

■ Function

In the case of a change, the telecontrol substation detects the process data and transfers it over the relevant WAN to SINAUT ST7sc. The received SINAUT messages are decoded here and stored in the ST7sc variable list as configured. An OPC client can read these received data from the ST7sc variable list via the OPC server interface "Data Access". This is performed either synchronously or asynchronously.

In the reverse direction, the OPC client can write data that is to be sent to a station (e.g. commands, set points, parameters) to the ST7sc variable list via the OPC server interface. These are converted to SINAUT data frames and sent via the WAN to the telecontrol substation specified by means of configuration.

A special feature of the telecontrol system is that process data are protected against loss. If the connection from the substation to the control room fails, for example, the local substation will save all the data changes that occur during the downtime complete with time stamps. This ensures that connection downtimes of several hours or even several days can be bridged without loss of data. So that the data saved in the substations will also arrive at the OPC client safely later, ST7sc contains the "item buffering" procedure, which helps to avoid data loss on the way to the OPC client:

- When the OPC "data access" interface that represents a process image is updated by the substations faster than the client can read it;
- When the OPC client is not available for a shorter or longer time or when the OPC communication path fails.

ST7sc normally only creates one "memory cell" per item in which the last status or value of the item is retained, but when the item buffering procedure is selected, one buffer is created per item in which all changes to the affected item are saved consecutively complete with time stamps. Saving is performed until the individual changes can be transferred to the OPC client.

The item buffering procedure requires an HMI application that can process time-stamped data even when the time stamp is several days old, e.g. following a long connection failure.

System configuration with SINAUT ST7sc

Redundant application

SINAUT ST7sc supports connection to a redundant client system. Two ST7sc systems must be used in this case. The data received from the stations are transferred by them in parallel and mutually independently to both clients and data are received from the clients that must be sent to the substations.

The redundancy mechanisms are located in this case on the client side:

- The client ensures that the data transferred in parallel is evaluated and compared correctly;
- The client transfers data to be sent to the substation once only to one of the two ST7sc, so that transmission is not duplicated.

Configuration

The ST7sc is configured using the ST7sc Config tool that is included in the scope of supply of the ST7sc software CD.

The documentation for the ST7sc and the Config tool is also located on this CD.

Industrial Remote Communication
TeleControl Professional for the substations

Introduction

Overview

Design principle of a telecontrol system and plants with SIMATIC

Telecontrol involves the connection of distant process stations to one or more central control systems. A telecontrol system can be subdivided into the following components

- Control center
- Substations
- Communication network

Various different public or private networks can be used for communication for the purposes of monitoring and control. The event-driven or cyclic exchange of the process data takes place via special telecontrol protocols such as SINAUT ST7, DNP3.

Substations

With SIMATIC, Siemens offers a wide range of components for the different application areas for establishing telecontrol substations – Remote Terminal Units (RTUs).

The hardware basis is a PLC, in each case supplemented for the telecontrol function with special hardware and software components, e.g. TIM communication modules. All the local functions supported by the respective PLC for the connection of I/O via bus systems, connection of HMI or sensors, etc., are also available without restriction in the RTU configuration.

The individual solutions differ in the

- performance class (number of required IO signals and controller performance)
- support for the telecontrol protocols

The following table provides an overview of the different types of substations on offer with the essential features.

	Telecontrol protocols					Private networks			Public networks			
	SINAUT ST1	Telecontrol Basic	SINAUT ST7	DNP3	IEC 60870-104 TCP/IP	Wireless	Dedicated line	WLAN	GPRS	EGPRS	UMTS	DSL

9

Overview (continued)

TIM communications modules

The hardware component for the telecontrol wireless station of a telecontrol substation is the TIM (**T**elecontrol **I**nterface **M**odule) communication module. It is used by the S7 CPU or control center PC for data exchange via the relevant telecontrol network, optionally with the SINAUT ST7, SINAUT ST1 or DNP3 protocol.

Different protocols cannot be combined in one communication network. However, communication networks with different protocols can always be combined in one project if they are connected to the central control center via separate interfaces.

Function

Each WAN interface of a TIM can be operated with the function "Station", "Node terminal" or "Control center" (exception: the function "Node terminal" is not available on the TIM 3V-IE, TIM 3V-IE DNP3, TIM 4R-IE DNP3, and the function "Control center" is not available on the TIM 3V-IE DNP3 and TIM 4R-IE DNP3). This enables the construction of the type of hierarchical communication structures required in classic WANs.

On IP-based networks, in which each partner has equal priority, this classification can be dismissed. The transmission via GPRS however represents an exception, as without special contracts with the GPRS Provider, direct communication from GPRS station to GPRS station is not possible. This can be solved by "re-routing" through a control center TIM, as in a classic WAN with cross-traffic on a dedicated leased line or wirelessly. In this case, the interfaces of the participating TIMs are to be set to the function "Control center" or "Station" in an IP-based network as well so that the correct path from "Station" to "Station" will be found automatically through the "Control center".

The TIM independently processes the data traffic via the network connected in each case and it does this according to the store-and-forward principle. For this purpose, the module has its own processor and a RAM for buffering data messages (depending on the type of TIM, between 10,000 and 56,000 message frames). The saving of the messages prevents a loss of data if the communication link is faulty or the partner fails. It also helps to reduce connection charges in dialup networks. If the optional backup battery is used for the TIM 4R-IE or TIM 4R-IE DNP3, stored data frames are not lost even if the 24 V supply voltage fails.

Reading and writing data that the TIM is to send or receive for a CPU can also be done with:

- **TD7onCPU**, the SINAUT TD7 software for the CPU, applicable to S7-300- and S7-400-CPUs as well as C7 compact control systems:
  The SINAUT program in the CPU, configured with modules from the SINAUT TD7 library, acquires the process data to be transferred, checks it for changes and transfers the changes to the TIM for transmission over the WAN. Messages received without faults by the TIM via the WAN are forwarded to the local CPU. A block that has been integrated there for evaluating the specific message frame ensures that the received information is output to the outputs or data areas configured in the block.
  This block library cannot be used in conjunction with TIM 3V-IE DNP3 or TIM 4R-IE DNP3.

- **TD7onTIM**, the SINAUT TD7 software integrated in the TIM (not present in the case of the TIM 4R / TIM 4RD), can be used with S7-300 CPUs and C7 compact control systems:
  The TD7onTIM program configured by the user reads the process data to be transferred directly from the memory areas of the CPU inserted into the S7-300 rack (inputs, bit memories, DBs), checks them for changes and then transfers the changes to the send buffer of the TIM for transmission over the WAN. Data from message frames received without fault by the TIM via the WAN are directly written by the TIM into the configured memory areas of the CPU.

If required, the data acquired by "TD7onCPU" or "TD7onTIM" can be tagged with a time stamp and the "normal" or "high" priority identification for transmission over a chargeable network, e.g. dial-up or GPRS. "TD7onTIM" also allows extremely important data to be identified with the "Interrupt" priority. These have priority over all other message frames saved in the send buffer, i.e. they are transmitted before the others.

If the local SINAUT station is a control center PC, operator inputs are recorded by the PC program in accordance with the ST7cc/ST7sc configuration, and transferred with the configured destination address to the TIM. Messages received without faults by the TIM via the WAN are forwarded to the control center PC. Evaluation of the relevant frame is handled by the control system software.

The TIM first saves the data to be sent in its RAM buffer. The subsequent response of the TIM on sending this data is explained in the two following sections.

9

■ **Function** (continued)

Communication via a classic WAN

The response of the TIM on sending the data depends on the WAN type and the TIM function that is set on the WAN interface:

- Dedicated line, wireless network;
  if the interface is operated in the function "station" or "node terminal", the TIM waits to be polled by the control center before it transfers the stored data message frames. If there are no message frames available, polling is simply acknowledged.
  If operated as a "control center", the TIM sends one of the message frames saved in the buffer following each completed poll + response (standard setting). If a larger number of message frames is to be sent between two polls, this can be specified when the TIM is configured.

- Dial-up network;
  in "station" or "node terminal" mode, the TIM will initially not be active in the case of data with "normal" priority. In the case of data of "high" or "interrupt" priority, the TIM will immediately try to establish a link to the addressed partner in order to transfer the data. If data of "normal" priority is also available in the TIM buffer at this time, this will be transferred immediately. Data of "interrupt" priority will always be transferred first. The data of "high" and "normal" priority will subsequently be transferred in accordance with the FIFO principle, i.e. regardless of their respective priority.
  If the interface is set to the "control center" function, the TIM will always try regardless of priority to establish a link to the addressed partner and to transfer the data.

The SINAUT ST7/ST1 protocol can be used for all WAN types and TIM functions. The DNP3 protocol only allows use of dedicated lines and wireless networks in the function "Station". The operating mode used depends on the type of WAN:

- Data exchange via dedicated line and wireless network usually takes place in "Polling" mode. In wireless networks with SINAUT ST7 protocol, the operating mode "Polling with time slot method" can be selected if required.

- On dial-up networks (only with SINAUT ST7/ST1 protocol), data exchange always takes place in "Spontaneous" mode.

Communication via an IP-based network

For transmission via an IP-based network, a permanent S7 connection via which the partners exchange the data packages is established in each case between two TIMs or between one TIM and the control system.

PG communication

PG communication allows all S7 stations connected to the LAN, e.g. Industrial Ethernet, to be remotely programmed. With the aid of S7 routing it is possible to use programming device communication across networks.

Cross-network PG communication functions with the SINAUT ST7 protocol for all classic and IP-based WANs. Remote programming and remote diagnosis of the stations connected to the WAN (CPUs and TIMs) is therefore possible.

In IP-based DNP3 networks, PG communication does not take place via the protocol itself, but via a separate PG connection (TCP/IP connection).

Diagnostics & service

The "SINAUT Diagnostics & Service Tool" provides comprehensive diagnostic functions and tools for commissioning and troubleshooting, e.g.:

- Operating status of the TIM
- Module status of the TIM
- General diagnostic information
- Diagnostics buffer of the TIM
- Status of the connections to local and remote communication partners (CPUs, TIMs, control systems)
- TIM frame monitor for recording the frame traffic
- Disabling and enabling stations in the dedicated line or wireless network, e.g. during commissioning

TIM modules with Ethernet interface also offer the following:

- Status and fill level of the send buffer, for each communication partner separately
- Diagnostic information regarding TD7onTIM

Configuration

The "SINAUT ST7 ES" configuring software is used for configuring the TIM. Modules from the "SINAUT TD7 module library" must be used for configuring the SINAUT program in the CPU (TD7onCPU). Both software packages are part of the SINAUT ST7 ES V5.1 engineering software. The SINAUT ST7 configuring software can be used provided that STEP 7 V5.4 with Service Pack 4 or later has been installed.

The configuration data – like the interface functionality, addresses of the communication participants, the telephone numbers of the partner in the dial-up network, etc. – that are required in each case can be saved in the Flash EPROM on every TIM or, in the case of the TIM 4R-IE or TIM 4R-IE DNP3, also on the optional plug-in C-PLUG. On all TIMs with Ethernet interface, the configuration data can also be stored on the memory card (MMC) of the CPU when installing in an S7-300 rack or in a C7 control system. The TIM can be replaced without the need for a programming device if the configuration data is saved in the CPU or in the C-PLUG.

Approvals

All TIM communication modules have the approvals CE, FM, ATEX, cUL508 (= UL508, CSA22.2) and cUL HazLoc. The TIM 3V-IE and TIM 4R-IE modules are also available in a SIPLUS version for the extended temperature range (-25 ... +70 °C).

Industrial Remote Communication
TeleControl Professional – Substations for ST7 protocol

Introduction

■ **Overview**

Substations for ST7 protocol

The TIM communication module is housed in an S7-300 enclosure and is available in different versions:

TIM 3V-IE/TIM 3V-IE Advanced

The TIM 3V-IE is a SINAUT communication module for the SIMATIC S7-300. It has an RS232 interface to which a matching external modem can be connected for data transfer via a conventional WAN. It additionally possesses an RJ45 interface, which permits communication over IP-based networks. In the case of the TIM 3V-IE, SINAUT communication can be processed alternately via one of the two interfaces, while in the TIM 3V-IE Advanced both interfaces can be operated simultaneously.

TIM 4R / TIM 4RD

The TIM 4R is a SINAUT communication module with flexible application options:

- Suitable for installation in a SIMATIC S7-300 as a communication module
- Also as an independent device (without S7-300 CPU), it can be connected via its MPI to one or more SIMATIC S7-300/-400 and to the control center PC (SINAUT ST7cc or ST7sc).

Apart from its MPI port, the TIM 4R has two RS232/RS485 interfaces for data transmission via conventional WANs. The two WAN networks can be different, for example, dedicated line plus telephone network, and operated independently of one another, but also in a redundant combination.

The TIM 4R is optionally available with an integrated DCF77 radio clock receiver (TIM 4RD). From this module, it is possible to supply the date and time to all nodes in the telecontrol system.

TIM 4R-IE

The TIM 4R-IE has two RS232/RS485 interfaces for data transmission via conventional WANs and additionally two RJ45 interfaces for connection to IP-based networks (WAN or LAN).

This TIM can be used as communication processor in a SIMATIC S7-300, but it is especially suitable as telecontrol module for a SIMATIC S7-400 or control center PC (SINAUT ST7cc or ST7sc). It is then connected without S7-300 CPU as a stand-alone device via one of the two Ethernet interfaces to the S7-400 or the PC .

The four transmission paths can all be different and operated independently of one another, but also in any redundant combination.

9

■ **Design**

Configuration examples

The figure below shows a simple S7-300 station equipped with a TIM 3V-IE. The S7-300 can be connected via the RS232 interface of the TIM to a conventional WAN (e.g. dedicated line or dialup network), and via the RJ45 interface to an IP-based network, e.g. GPRS. If the S7-300 were equipped with a TIM 3V-IE Advanced, the two interfaces could be used simultaneously for SINAUT communication.

S7-300 with TIM 3V-IE

In the case of an S7-400, both a TIM 4R and a TIM 4R-IE can be used for data communication. In both cases the TIM is used as an independent device, i.e. without S7-300 CPU. The TIM 4R is connected to the S7-400 via MPI, while the TIM 4R-IE is connected via one of the two Ethernet interfaces of this module. The figures below illustrate the two alternatives.

S7-400 with TIM 4R connected via MPI

S7-400 with TIM 4R-IE connected via Industrial Ethernet

In the case of the TIM 4R, two conventional WANs can be connected by means of the two combined RS232/RS485 interfaces. The TIM 4R-IE has an additional connection for an IP-based network.

As on an S7-400, the control center PC (e.g. SINAUT ST7cc or ST7sc) is interfaced with the SINAUT telecontrol network via one or more TIM 4 modules. The two figures below show the alternatives with TIM 4R or TIM 4R-IE.

SINAUT ST7cc/ST7sc with one or more TIM 4R's on the MPI bus

SINAUT ST7cc/ST7sc with one or more TIM 4R-IE's on the Industrial Ethernet

9

Introduction

Design (continued)

One of the TIM 4R modules could be a TIM 4RD with integral DCF77 radio clock receiver. This then synchronizes all TIMs connected to the MPI, as well as the control center PC (ST7cc or ST7sc). The synchronized TIMs then supply the date and time at regular intervals to their SINAUT stations connected via WAN. If no DCF77 time signal is available at the installation location of the TIM 4RD, a SINAUT GPS receiver can be connected to the TIM 4RD. The universally available global positioning system (GPS) is then used as a time source.

The synchronization of the TIM 4R-IE module clocks connected via Ethernet is performed by the control center PC (ST7cc or ST7sc). These TIMs then supply their SINAUT stations in turn.

If stations are connected by means of an IP-based network, the connection to the control center PC (ST7cc or ST7sc) may also be made directly, i.e. without any TIM 4R-IE on the PC. The figure below shows the example of a plant in which the stations are connected directly to the SINAUT control center by means of a fiber optic ring. The SINAUT stations in this directly connected IP-based network are synchronized via the control center PC.

SINAUT ST7cc/ST7sc connected directly to SINAUT terminals via an IP-based network

In the case of more complex IP-based networks, and above all when using a redundant control center, the use of a control center TIM 4R-IE is recommended, since this permits improved monitoring of network behavior and optimization of the connection resources of the PC.

Overview

- SINAUT communications module TIM for SIMATIC S7-300 for use in a wide area network (WAN)
- IP communication via secure VPN (virtual private network) using the Internet
- Wireless communication via GPRS router, GPRS modem, or radio devices
- Wired communication via Ethernet, DSL, dialup modems or dedicated line modem
- Complete migration of existing wireless, dedicated line and dial-up technology to IP-based network
- Message frame memory for complete recording of data
- Simple configuration and operation without specialist IT knowledge

Benefits

g e t **get**   Designed for Industry

- Flexible option for connection to any IP-based or conventional WAN
- Economical station design and low connection costs due to GPRS connection with the MD720-3 and utilizing the S7-CPUs 312 and 312C
- No additional mobile phone service for fixed IP addresses or contracts for private GPRS networks with bidirectional data traffic are necessary, as the VPN is integrated in the ST7 system. No more expensive and complex VPN configuration by IT specialists.
- Saving of traveling costs due to cost-effective remote programming, diagnostics, control and monitoring via the Internet
- Reduction in time and costs thanks to quick and user-friendly configuration of connections and data to be transferred with the SINAUT configuring software and block library
- Reliable storage of important data. Storage of data message frames (max. 16,000) including time stamp on TIM if the communication path is faulty or a partner has failed and to reduce connection costs for the dial-up network.
- Protection of investment for existing SINAUT ST1 systems through the integration of the SIMATIC S7-300

Application

- Low-cost automation of water/wastewater networks with both complex and simple structures
- Control and monitoring of energy distribution systems and supply stations, such as oil, gas or district heating networks
- Preventive maintenance (condition monitoring) of globally distributed systems
- Monitoring of logistics and traffic control systems
- Connection of plants with basic or high-level security and availability requirements
- Use in hybrid networks with dialup, wireless, Ethernet or Internet communication

Design

The TIM 3V-IE offers all the advantages of the SIMATIC S7-300 design:

- Compact design
- 9-pin Sub-D connector with an RS232 interface for connection to a conventional WAN via an appropriate modem
- RJ45 socket for connection to Industrial Ethernet or an IP-based network; industry-standard design with additional sleeve for connecting the IE FC RJ45 Plug 180
- 2-pin plug-in terminal strip for connection of the 24 V DC external supply voltage
- Front LEDs for indicating the module status and the communication
- Simple installation; the TIM 3V-IE is mounted on the rail of the S7-300 and connected to the adjacent modules by means of the bus connectors supplied with the TIM. No slot rules apply.
- Can be operated in the expansion rack (ER) in conjunction with the IM 360/361
- Can be operated without a fan
- A battery backup or memory module are not required

9

Industrial Remote Communication
TeleControl Professional – Substations for ST7 protocol

TIM 3V-IE for WAN and Ethernet

■ Function

- The TIM 3V-IE enables a SIMATIC S7-300 to exchange data with other SINAUT ST7 or ST1 stations via any SINAUT network. The important SINAUT property - saving data complete with a time stamp on the TIM in the event of an interrupted link or failure of the partner - is then available not only for conventional WANs, but also for IP-based networks. Important events, alarms, etc. are not lost and the integrity of information in control center system archives is assured.

- The TIM 3V-IE module is particularly suitable for configuring low-cost stations, but also allows a simple S7-300 control center to be implemented. The module cannot be used in a SINAUT node station or combined with other TIMs in a control center.

- The SINAUT TD7 software for the CPU (TD7onCPU) is now integrated in the TIM 3V-IE (TD7onTIM). This enables the smallest S7 CPUs 312 and 312C to be used, because in the most favorable situation, no CPU RAM is required any more for SINAUT. (This does not apply to communication with SINAUT ST1 partners or the transmission of text messages; in these cases, the SINAUT TD7 software must be used for the CPU (TD7onCPU).) One TIM 3V-IE can be used per S7-300 and one of the two interfaces (RS232 or RJ45) can be used for SINAUT communication (not both simultaneously). PG communication is possible at any time over the Ethernet interface.

- Message frame memory for up to 16000 data message frames
- Up to eight S7 connections via IP-based networks

Controllable communication modules:
- Control of the GSM/GPRS modems MD720-3 in GSM or GPRS mode. In GPRS mode, simple 128-bit encryption via the MD720-3 (MSC-VPN tunnel protocol).
- Operation via SIMATIC NET Ethernet components with high IPsec security standard (e.g. GPRS router or SCALANCE S)
- Use of SCALANCE fiber-optic switches for spanning long distances
- Wireless transmission via IWLAN with SCALANCE W over medium distances
- Dedicated line modem MD2 for point-to-point, point-to-multipoint or line connections
- Wireless devices from various manufacturers, also for private mobile radio using the time slot method
- Analog dial-up modem MD3 for the analog telephone network or point-to-point dedicated lines

■ Integration

Connection to IP-based networks

In addition to the RS232 interface, the TIM 3V-IE also has an RJ45 socket. This is suitable for the connection of IP-based networks (WAN or LAN). Depending on the application, various types of data communication equipment can be connected such as:

- SCALANCE X switches for Twisted Pair cable or fiber-optic cables
- SCALANCE W (IWLAN) and Ethernet radio devices from various manufacturers
- SCALANCE M873/875 for UMTS communication via mobile telephone networks
- EGPRS router MD741-1 for GPRS communication and EGPRS (EDGE) over mobile telephone networks
- GPRS/GSM modem MD720-3 for GPRS communication over mobile telephone networks
- DSL router and SCALANCE S
- Broadband systems such as OTN and PCM30

Configuration examples in IP-based networks

Connection via switches, e.g. SCALANCE X

Simple network structures can be built up in this manner, or complex ones that comprise a combination of star, line and ring structures. At the control desk (e.g. ST7cc) the use of a TIM 4R-IE is not necessary, i.e. the connection is made directly to the Ethernet interface of the PC.

■ **Integration** (continued)

Wireless with Ethernet

When wired Ethernet communication is not possible, a wireless network can be installed using commercially available Ethernet wireless modems or with IWLAN. In order to decouple the networks, the connection in the control center can be made via a TIM 4R-IE, as in the example, or directly to the Ethernet interface of the PC.

Transmission over DSL

The continuously falling flat rates for DSL connections make this medium an interesting alternative to a leased line or also a telephone connection. DSL routers must be used in the station and control center, preferably routers in combination with SCALANCE S (VPN), in order to establish secure connections using VPN tunnels. A permanent IP address is recommended for DSL connection of the control center, the IP addresses of the stations can be dynamically assigned.

In order to decouple the networks, the connection in the control center can be made via a TIM 4R-IE or directly to the Ethernet interface of the PC.

Industrial Remote Communication
TeleControl Professional – Substations for ST7 protocol

TIM 3V-IE for WAN and Ethernet

■ **Integration** (continued)

Transmission over the GPRS mobile telephone service and the Internet

Continuous coverage of GPRS in many countries as well as inexpensive volume tariffs allow wireless connection of stations to the control desk without the need to create a separate radio network for this purpose. The stations can be either stationary or mobile.

The wireless connection is constantly online and therefore has the same properties as a dedicated line: Data changes can be transferred immediately and station or connection failures are detected at an early stage.

GPRS with simple stations

A TIM 3V-IE is used in the stations together with the GSM/GPRS modem MD720-3 or a TIM3V-IE Advanced with DSL router. The simple VPN protocol MSC of the MD720-3 permits communication via GPRS access and Internet and via routers with NAT or NAPT conversion. The MSC tunnel connections correspond to dedicated lines that are permanently maintained with extremely low volumes of data. When using the MSC tunnel, a TIM 4R-IE must be used as a header station at which the tunnels end. The parameter setting of the MSC connection is performed in the SINAUT ST7 configuration software.

GPRS/UMTS with complex stations and enhanced security

The EGPRS router MD741-1, which is a combination of high-speed GPRS VPN router with enhanced data security (IPsec protocol) and firewall, is used in networked stations. In the stations, other devices connected via Industrial Ethernet to the MD741-1 for diagnosis and parameterization can be accessed from the control center.

For higher data rates, in place of the GRPS router MD741-1, the UMTS Router SCALANCE M875 can be implemented for use of the UMTS mobile radio network.

The control desk PC must be constantly accessible from the GPRS network. It must therefore be directly connected to the GPRS provider using a dedicated line or permanently to the Internet, e.g. by means of DSL. A SCALANCE S612 or S623 [1] Security Module performs the firewall function at the control desk and represents the remote stations for the VPN connections of the GPRS stations. The VPN is configured with the SIMATIC NET "Security Configuration Tool" and requires no special IT knowledge.

The IP address of the control center should preferably be permanent; those of the stations can be dynamically assigned.

[1] Available soon

■ **Integration** (continued)

Connection to a conventional WAN

Connection to a conventional WAN is via the floating RS232 interface of the TIM 3V-IE module, via which various modems or data communication equipment can be connected, depending on the application, such as:

- Dedicated line modem MD2 for point-to-point, point-to-multipoint or line connections
- Wireless devices from various manufacturers, also for private mobile radio using the time slot method
- Analog dial-up modem MD3 for the analog telephone network or point-to-point dedicated lines
- GSM modem MD720-3 for access to the mobile radio network via dial-up lines

Configuration examples in the conventional WAN

Use of the TIM 3V-IE in the mobile radio network (GSM)

The GSM modem MD720-3 is used for this purpose. At the control desk (ST7cc or ST7sc), it is connected through a TIM 4 module (e.g. TIM 4R-IE) that is connected to the PC via the Industrial Ethernet. The connections between the GSM modems are set up via GSM dial-up lines.

Use of the TIM 3V-IE in a private radio network

The radio network must be installed in accordance with the radio equipment that is approved in the relevant country (radio equipment is not included in the SINAUT product range). At the control desk (ST7cc or ST7sc), it is connected through a TIM 4 module (e.g. TIM 4R) that is connected to the PC via MPI. If a radio network is set up with time slot procedure, the TIM 4RD with DCF77 radio clock receiver must be used at the control desk.

■ **Technical specifications** (continued)

Order No.	6NH7 800-3BA00
Product type designation	**TIM 3V-IE**
Performance data Telecontrol	
Suitability for use	
• TIM node station	No
• TIM station	Yes
• TIM control center	No
• Note	RS232 and Industrial Ethernet cannot be used simultaneously
Protocol is supported	
• TCP/IP	Yes
• DNP3	No
• SINAUT ST1 protocol	Yes
• SINAUT ST7 protocol	Yes
Product function: data buffering if connection is aborted	Yes
• Note	16,000 data frames
Memory capacity	
• of S7 CPU's main memory	
- Required on CPU for TD7 on CPU mode data blocks	20 Kibyte
- Required on TIM for TD7 on TIM mode data blocks	0 Kibyte
• Note	TD7onCPU: at least 20 KB, actual requirement depends on data quantity and functional scope TD7onTIM: 0 bytes in most favorable case
Product property: buffered message frame memory	No
Transmission format	
• 11 bits for SINAUT ST1 protocol with polling	Yes
• 10 or 11 bits for SINAUT ST1 protocol with spontaneous polling	Yes
• 10 bits for SINAUT ST7 protocol with multi-master polling	Yes
• 10 or 11 bits for SINAUT ST7 protocol with polling or spontaneous polling	Yes
Operating mode with scanning of data transmission	
• With dedicated line/radio link	
- With SINAUT ST1 protocol	Polling, polling with time slot procedure
- With SINAUT ST7 protocol	Polling, polling with time slot procedure, multi-master polling with time slot procedure
• With dial-up network	
- With SINAUT ST1 protocol	Spontaneous
- With SINAUT ST7 protocol	Spontaneous
Hamming distance	
• For SINAUT ST1 protocol	4
• For SINAUT ST7 protocol	4

Order No.	6NH7 800-3BA00
Product type designation	**TIM 3V-IE**
Product functions Management, configuration, programming	
Configuration software	
• Required	SINAUT ST7 ES
• Required for CPU configuration: SINAUT TD7 block library for CPU	Yes
• Required for PG configuration: SINAUT ST7 configuration software for PG	Yes
Storage location of TIM configuration data	On the TIM
Product functions Security Virtual Private Network	
Suitability for use of Virtual Private Network	Yes
Virtual Private Network mode - Note	VPN mode as MSC client with MSC protocol and password protection only possible together with GPRS modem with MSC capability

SIPLUS TIM 3V-IE for WAN and Ethernet

■ **Overview**

- SINAUT communication module SIPLUS TIM for SIMATIC S7-300 for use in a wide area network (WAN)
- IP communication via secure VPN (virtual private network) using the Internet
- Wireless communication via GPRS router, GPRS modem, or radio devices
- Wired communication via Ethernet, DSL, dialup modems or dedicated line modem
- Complete migration of existing wireless, dedicated line and dial-up technology to IP-based network
- Message frame memory for seamless recording of data
- Simple configuration and operation without specialist IT knowledge

Note:

SIPLUS extreme products are based on Siemens Industry standard products. The contents listed here were taken from the respective standard products. SIPLUS extreme-specific information was added.

SIPLUS TIM 3V-IE	
Order number	**6AG1 800-3BA00-7AA0**
Order No. based on	**6NH7 800-3BA00**
Ambient temperature range	-25 … +70 °C
Conformal coating	Coating of the printed circuit boards and the electronic components
Technical data	The technical data of the standard product applies except for the ambient conditions.
Ambient conditions	
Relative humidity	5 ... 100 % Condensation permissible
Biologically active substances	Conformity with EN 60721-3-3, Class 3B2 mold and fungal spores (except fauna)
Chemically active substances	Conformity with EN 60721-3-3, Class 3C4 incl. salt mist and ISA–S71.04 severity level G1; G2; G3; GX [1] [2]
Mechanically active substances	Conformity with EN 60721-3-3, Class 3S4 including conductive sand, dust [2]
Air pressure (depending on the highest positive temperature range specified)	1080 ... 795 hPa (-1000 ... +2000 m) see ambient temperature range
	795 ... 658 hPa (+2000 ... +3500 m) derating 10 K
	658 ... 540 hPa (+3500 ... +5000 m) derating 20 K

[1] ISA-S71.04 severity level GX: Long-term load: SO_2 < 4.8 ppm; H_2S < 9.9 ppm; Cl < 0.2 ppm; HCl < 0.66 ppm; HF < 0.12 ppm; NH < 49 ppm; O_3 < 0.1 ppm; NOX < 5.2 ppm
Limit value (max. 30 min/d): SO_2 < 17.8 ppm; H_2S < 49.7 ppm; Cl < 1.0 ppm; HCl < 3.3 ppm; HF < 2.4 ppm; NH < 247 ppm; O_3 < 1.0 ppm; NOX < 10.4 ppm

[2] The supplied plug covers must remain in place over the unused interface when operated in atmospheres containing corrosive gases!

Industrial Remote Communication
TeleControl Professional – Substations for ST7 protocol

TIM 3V-IE Advanced

■ **Overview**

- SINAUT communications module TIM for SIMATIC S7-300 for use in wide area network (WAN) as station, node station, and control center
- IP communication via secure VPN (virtual private network) using the Internet
- Wireless communication via GPRS router, GPRS modem or radio devices
- Wired communication via Ethernet, DSL, dialup modems or dedicated line modem
- Complete migration of existing wireless, dedicated line and dial-up technology to IP-based network
- Message frame memory for complete recording of data and support of redundant communication paths
- Simple configuration and operation without specialist IT knowledge

■ **Benefits**

Designed for Industry

- Flexible option for connection to any conventional or IP-based WAN
- Low-cost station setup by means of direct connection to DSL router or GPRS via MD720-3 modem and use of the S7-CPUs 312 and 312C, because the SINAUT TD7 CPU software is integrated in the TIM 3V-IE Advanced. (This does not apply to communication with SINAUT ST1 partners and to the transmission of text messages; in this case the SINAUT TD7 software for the CPU (TD7onCPU) must be used, i.e. this software can still be used together with the TIM 3V-IE Advanced.)
- No additional mobile phone service for fixed IP addresses or contracts for private GPRS networks with bidirectional data traffic are necessary, as the VPN is integrated in the ST7 system. No more expensive and complex VPN configuration by IT specialists.
- Saving of traveling and maintenance costs due to cost-effective remote programming, diagnostics, control and monitoring via the Internet

- Reduction in time and costs thanks to quick and user-friendly configuration of connections and data to be transferred with the SINAUT configuring software and block library
- High availability of the connections thanks to possible redundant design of the communication paths (parallel operation of WAN networks supported on RJ45 and RS232 interface of the TIM 3V-IE Advanced)
- Reliable storage of important data. Storage of data message frames (max. 32,000) including time stamp on TIM if the communication path is faulty or a partner has failed and to reduce connection costs for the dial-up network.
- Protection of investment for existing SINAUT ST1 systems through the integration of the SIMATIC S7-300

■ **Application**

- Low-cost automation of water/wastewater networks with both complex and simple structures
- Control and monitoring of energy distribution systems and supply stations, such as oil, gas or district heating networks
- Preventive maintenance (condition monitoring) of globally distributed systems
- Monitoring of logistics and traffic control systems
- Connection of plants with basic or high-level security and availability requirements
- Use in hybrid networks with dialup, wireless, Ethernet or Internet communication

■ **Design**

The TIM 3V-IE Advanced offers all the advantages of the SIMATIC S7-300 design:

- Compact construction; single standard width of the SIMATIC S7-300 SM modules
- 9-pin Sub-D connector with an RS232 interface for connection to a conventional WAN via an appropriate modem
- RJ-45 socket for connection to Industrial Ethernet; or an IP-based network; industrial design with additional sleeve for inserting the IE FC RJ45 Plug 180
- 2-pin plug-in terminal strip for connection of the 24 V DC external supply voltage
- Front LEDs for indicating the module status and the communication
- Easy to mount; the TIM 3V-IE Advanced is mounted on the S7-300 mounting rail and connected to adjacent modules by means of the bus connectors. No slot rules apply.
- Can be operated in the expansion rack (ER) in conjunction with the IM 360/361
- Can be operated without a fan
- A battery backup or memory module are not required

Industrial Remote Communication
TeleControl Professional – Substations for ST7 protocol

■ Function

- The TIM 3V-IE Advanced enables one or more SIMATIC S7-300 or control center PCs (e.g. SINAUT ST7cc or ST7sc) to exchange data with other SINAUT ST7 or ST1 stations via any one or two SINAUT networks. The two networks can also be operated in redundant combination. The important SINAUT property - saving data complete with a time stamp on the TIM in the event of an interrupted link or failure of the partner - is then available not only for conventional WANs, but also for IP-based networks. Important events, alarms, etc. are not lost and the integrity of information in control center system archives is assured.

- For setting up more complex control centers or node stations, several TIM 3V-IE Advanced modules can be used for each S7-300. A combination with additional TIM 3 and TIM 4 versions in the same rack is possible here.

- SINAUT ST7 and thus also the TIM 3V-IE Advanced are designed for data transmission via the widest range of WANs or combinations of WANs. Mixed networks comprising classical SINAUT WAN networks (dedicated line, wireless, dial-up network) and IP-based networks (fiber optic, DSL, GPRS, Internet etc.) can be configured uniformly using SINAUT, which saves both time and money.

- For communication via the Internet, the integrated MSC-VPN tunnel protocol for direct access to DSL routers can be used (MSC client). For communication via GPRS, either the router MD741-1 can be connected to the IE interface (VPN IPsec) or the GSM/GPRS modem MD720-3 (MSC-VPN) to the RS232 interface.

- PG communication is possible parallel to data communication at any time

- Several TIM 3V-IE Advanced can be used per S7-300

- Message frame memory for up to 32000 data message frames

- Up to twenty S7 connections via IP-based networks

Controllable communication modules:

- Control of the GSM/GPRS modems MD720-3 in GSM or GPRS mode. In the GPRS mode, simple 128-bit encryption via the MD720-3 (MSC-VPN tunnel protocol)

- Operation via SIMATIC NET Ethernet components with high IPsec security standard (e.g. GPRS router or SCALANCE S)

- Direct operation on a DSL router by means of MSC tunnel protocol

- Use of SCALANCE fiber-optic switches for spanning long distances

- Wireless transmission via IWLAN with SCALANCE W over medium distances

- Dedicated line modem MD2 for point-to-point, point-to-multipoint or line connections

- Wireless devices from various manufacturers, also for private mobile radio using the time slot method

- Analog dial-up modem MD3 for the analog telephone network or point-to-point dedicated lines

- ISDN modem MD4 for connecting to the ISDN network

■ Integration

Connection to IP-based networks

In addition to the RS232 interface, the TIM 3V-IE Advanced also has an RJ45 socket. This is suitable for the connection of IP-based networks (WAN or LAN). Depending on the application, various types of data communication equipment can be connected such as:

- SCALANCE X switches for Twisted Pair cable or fiber-optic cables

- SCALANCE W (IWLAN) and Ethernet radio devices from various manufacturers

- EDGE router MD741-1 for GPRS communication and EGPRS (Edge) over mobile telephone networks

- SCALANCE M873/875 for UMTS communication via mobile telephone networks

- GPRS/GSM modem MD720-3 for GPRS communication over mobile telephone networks

- DSL router and SCALANCE S for VPN (IPsec)

- DSL router directly by means of MSC-VPN tunnel protocol integrated in the TIM

- Broadband systems such as OTN and PCM30

Configuration examples with TIM 3V-IE Advanced

Use as a station

The TIM 3V-IE Advanced can be used as a station like a TIM 3V-IE. In addition, transmission is possible via the direct connection of the TIM to a DSL router (MSC tunnel).

Use the MSC tunnel protocol (MSC client) integrated in the TIM 3V-IE Advanced to operate a connection via Industrial Ethernet and a DSL router to a TIM 4R-IE that terminates the MSC tunnel protocol.

9

Industrial Remote Communication
TeleControl Professional – Substations for ST7 protocol

TIM 3V-IE Advanced

■ **Integration** (continued)

Use in a node station

When used in a node station, TIM 3V-IE Advanced can, for example, exchange data over its RS232 interface over a radio network with the lower-level stations. It is then connected to the control desk over the RJ45 interface, e.g. over a fiber-optic cable, that is connected through SCALANCE X switches. In this configuration, data can be exchanged between each of the SINAUT stations regardless of which network they are situated in.

In this case, in order to disconnect the networks, the connection in the control center can be made via a TIM 4R-IE or, as in the example, directly to the Ethernet interface of the PC.

Redundant transmission paths

Using TIM 3V-IE Advanced, a station can be connected to the control desk over redundant paths. The TIM 3V-IE Advanced is used for this purpose both in the station and in the control center. The example includes a combination of fiber-optic cables and radio paths as redundant paths. The two TIMs coordinate data transmission: It takes place normally over the main path and only if it fails over the standby path. When the main path is restored, changeover back to this path is performed automatically.

The TIM 3V-IE Advanced in the control center has access to the MPI interface of the S7-300-CPU via the backplane bus, by which the TIM communicates with the control desk PC (e.g. ST7cc). Note that only certain types of CPU can be considered for this application. A TIM 4R-IE can be used in the control center as a replacement for the TIM 3V-IE Advanced. Without a S7-300-CPU, this TIM is connected to the control desk PC via one of the two Ethernet ports.

Note:

Use of the MPI port of the local CPU is possible with the following types of CPU: all versions of the CPUs 312, 312C, 313C, 314 and 314C, the CPUs 315-2 DP and 315F-2 DP.

9

Integration (continued)

Use in a control center

The TIM 3V-IE Advanced is also suitable for configuring a control center that comprises more than one TIM. In the following example, the TIM 3V-IE Advanced is combined with a TIM 4R-IE. Both TIMs are connected via the MPI with the CPU inserted in the rack. Both TIMs process data communication with the stations in their own networks and route the data via Industrial Ethernet to the PC.

Connection to a conventional WAN

Connection to a conventional WAN is via the floating RS232 interface of the TIM 3V-IE Advanced module, via which various modems or data communication equipment can be connected, depending on the application. The RS232 interface can then be operated parallel to the Industrial Ethernet interface.

TIM 3V-IE Advanced

■ **Technical specifications**

Order No.	6NH7 800-3CA00
Product type designation	**TIM 3V-IE Advanced**
Transmission rate	
Transmission rate with Industrial Ethernet	10 … 100 Mbit/s
Transmission rate in accordance with RS 232	50 … 38 400 bit/s
Interfaces	
Number of interfaces in accordance with Industrial Ethernet	1
Number of electrical connections	
• For external data transmission in accordance with RS 232	1
• For power supply	1
Design of electrical connection	
• of the Industrial Ethernet interface	RJ45 port
• at interface 1 for external data transmission	9-pin D-sub male connector (RS232)
• at interface 2 for external data transmission	-
• For power supply	2-pin, pluggable terminal strip
Design of the swap medium C-Plug	No
Supply voltage, current consumption, power loss	
Type of power supply	DC
Power supply	24 V
• Minimum	20.4 V
• Maximum	28.8 V
Current consumed	
• Maximum from backplane bus for 24 V DC	0.2 A
• Maximum from external power supply for 24 V DC	0.2 A
Effective power loss	5.8 W
Product expansion: optional backup battery	No
Type of battery	-
Backup current	
• Typical	-
• Maximum	-
Permitted ambient conditions	
Ambient temperature	
• During operation	0 … 60 °C
• During storage	-40 … +70 °C
• During transport	-40 … +70 °C
Relative humidity at 25 °C without condensation during operation, maximum	95 %
IP degree of protection	IP20

Order No.	6NH7 800-3CA00
Product type designation	**TIM 3V-IE Advanced**
Design, dimensions and weights	
Module format	S7-300 compact module, single- width
Width	40 mm
Height	125 mm
Depth	120 mm
Net weight	0.25 kg
Product properties, functions, components General	
Number of modules - Note	Number of TIM per S7-300: several, number depends on connection resources of S7-300 CPU

■ **Technical specifications** (continued)

Order No.	6NH7 800-3CA00
Product type designation	**TIM 3V-IE Advanced**
Performance data Telecontrol	
Suitability for use	
• TIM node station	Yes
• TIM station	Yes
• TIM control center	Yes
• Note	RS232 and Industrial Ethernet can be used simultaneously
Protocol is supported	
• TCP/IP	Yes
• DNP3	No
• SINAUT ST1 protocol	Yes
• SINAUT ST7 protocol	Yes
Product function: data buffering if connection is aborted	Yes
• Note	32,000 data frames
Memory capacity	
• of S7 CPU's main memory	
- Required on CPU for TD7 on CPU mode data blocks	20 Kibyte
- Required on TIM for TD7on TIM mode data blocks	0 Kibyte
• Note	TD7onCPU: at least 20 KB, actual requirement depends on data quantity and functional scope TD7onTIM: 0 bytes in most favorable case
Product property: buffered message frame memory	No
Transmission format	
• 11 bits for SINAUT ST1 protocol with polling	Yes
• 10 or 11 bits for SINAUT ST1 protocol with spontaneous polling	Yes
• 10 bits for SINAUT ST7 protocol with multi-master polling	Yes
• 10 or 11 bits for SINAUT ST7 protocol with polling or spontaneous polling	Yes
Operating mode with scanning of data transmission	
• With dedicated line/radio link	
- With SINAUT ST1 protocol	Polling, polling with time slot procedure
- With SINAUT ST7 protocol	Polling, polling with time slot procedure, multi-master polling with time slot procedure
• With dial-up network	
- With SINAUT ST1 protocol	Spontaneous
- With SINAUT ST7 protocol	Spontaneous
Hamming distance	
• For SINAUT ST1 protocol	4
• For SINAUT ST7 protocol	4

Order No.	6NH7 800-3CA00
Product type designation	**TIM 3V-IE Advanced**
Product functions Management, configuration, programming	
Configuration software	
• Required	SINAUT ST7 ES
• Required for CPU configuration: SINAUT TD7 block library for CPU	Yes
• Required for PG configuration: SINAUT ST7 configuration software for PG	Yes
Storage location of TIM configuration data	On the TIM
Product functions Security Virtual Private Network	
Suitability for use of Virtual Private Network	Yes
Product function	
• Password protection for VPN	Yes
• MSC client via GPRS modem with MSC capability	Yes
MSC protocol is supported	Yes
Number of possible connections	
• As MSC client with VPN connection	1
• As MSC server with VPN connection	0
MSC protocol supported with Virtual Private Network	TCP/IP
Key length for MSC with Virtual Private Network	128 bits
Type of authentication with Virtual Private Network PSK	Yes

Preadjusted stripping tool for fast stripping of the Industrial Ethernet FC cables	
Connecting cable	**6NH7 701-4AL**
For connecting a TIM (RS232) with a SINAUT ST7 MD2, MD3 or MD4 (RS232) modem; cable length 1.5 m	
Connecting cable	**6NH7 701-5AN**
For connecting a TIM (RS232) with the GSM modem MD720-3; also suitable for third-party modems or radio equipment with standard RS232 interface; cable length 2.5 m	
Connecting cable	**6NH7 701-4BN**
with one end open for connecting a TIM (RS232) to a third-party modem or radio unit (RS232); cable length 2.5 m	
Connecting cable	**6NH7 701-0AR**
For connecting two TIM modules via their RS232 interface without modems ("null modem"); cable length 6 m	

9

■ **Overview**

- SINAUT communication module TIM for SIMATIC S7-300, S7-400 and PC

- For universal use in a SINAUT station, node station and control center

- Wireless communication via GSM modem or wireless devices

- Wired communication via dialup modems or dedicated line modem

- Message frame memory for seamless recording of data and support of redundant communication paths

- The TIM 4RD also features a built-in DCF77 radio clock receiver to supply the date/time to all SINAUT stations connected locally or, for use in a control center, to synchronize all SINAUT devices on the WAN.

■ **Benefits**

get Designed for Industry

- Flexible option for connection to any two conventional SINAUT networks

- Can be used universally with S7-300, S7-400, or control center PC.

- In the TIM 4RD version the correct date and time is always available, including summer/winter clock change.

- Reduction in time and costs thanks to quick and user-friendly configuration of connections and data to be transferred with the SINAUT configuring software and block library.

- Reliable storage of important data.
  Storage of data message frames (approx. 10,000) including time stamp on TIM, if the communication path is faulty or a partner has failed and to reduce connection costs for the dial-up network.

- Remote programming and remote diagnostics (PC routing) in parallel with data transmission via the WAN connection saves time and money.

- Investment protection for existing SINAUT ST1 systems through the integration of the SIMATIC S7-300 and S7-400 by means of ST1-compatible communication.

■ **Application**

- Low-cost automation of water/wastewater networks with both complex and simple structures

- Control and monitoring of energy distribution systems and supply stations, such as oil, gas or district heating networks

- Preventive maintenance (condition monitoring) of globally distributed systems

- Monitoring of logistics and traffic control systems

- Connection of plants with basic or high availability requirements

- Use in classic SINAUT networks

■ **Design**

The TIM 4R/4RD offers all the advantages of the SIMATIC S7-300 design:

- Compact design;
  double standard width of SIMATIC S7-300 SM modules.

- 9-pin Sub-D connector with a combined RS 232/RS 485 interface for connection to a conventional WAN via an appropriate modem.

- RJ45 socket as a further combined RS232/RS485 interface. The supplied RJ45/Sub-D (6NH7700-0AS05) interface adapter cable in turn provides a 9-pin Sub-D connector for connection to a conventional WAN via an appropriate modem.

- MPI (9-pin sub-D socket) for connection of the TIM as a standalone device to one or more S7-CPUs or control center PCs.

- 4-pin plug-in terminal strip for connection of the 24 V DC external supply voltage

- Front LEDs for indicating the module status and the communication

- The DCF77 adapter cable (6NH7700-0AD15) supplied with the TIM 4RD provides a BNC connector for connection of the antenna cable.

- Easy to mount;
  The TIM is mounted on an S7-300 mounting rail;
  if integrated into an S7-300 as a CP, it is connected to adjacent modules by means of the bus connector supplied with the TIM. No slot rules apply. As a standalone device, it is linked via its MPI with one or more S7 CPUs or with one or more control center PCs.

- Can be operated in the expansion rack (ER) in conjunction with the IM 360/361

- Can be operated without a fan

- A battery backup or memory module are not required

9

Industrial Remote Communication
TeleControl Professional – Substations for ST7 protocol

TIM 4R / TIM 4RD

■ Function

The TIM 4R/4RD can be used as a standalone device, in other words, it is fully functional even without S7-300-CPU. In this stand-alone mode, the TIM is especially suitable as a SINAUT communications processor for the control desk PC (e.g. SINAUT ST7cc or ST7sc) or for a SIMATIC S7-400. The TIM is connected to the PC or S7-400 via the MPI (multi-point interface) of the TIM. If the control center is redundantly designed or if an S7-400 is additionally available there as a higher-level controller, then the TIM performs the SINAUT communication with the stations for all these devices connected to the local MPI bus.

The TIM 4R/4RD can also be built into a SIMATIC S7-300 as a CP, e.g. if these devices require redundant transmission paths there or function as node stations at which more than two standard WANs must be merged.

All the devices mentioned can exchange data with other SINAUT ST7 or ST1 partners with the aid of the TIM 4R/4RD via any two SINAUT networks that can also be operated in a redundant combination. All three interfaces can be used at the same time for SINAUT communication.

The TIM can buffer process data including time-stamps, which must not be lost in the event of a communication fault or the failure of a partner, until the partner is accessible again. Important events, interrupts, etc. are not lost and the integrity of information in control center system archives is assured.

The TIM 4RD with integral DCF77 radio clock receiver can be used in the control center as a master clock to synchronize all SINAUT stations that are accessible via the MPI bus and via the two RS232/RS485 WAN interfaces. In addition, this TIM is to be used in the control center if the SINAUT data transmission is processed via a wireless network with time slot procedure or if the "multi-master-polling with time-slot procedure" is used for two or more control centers. If no DCF77 time signal is available at the installation location of the TIM 4RD, a SINAUT GPS receiver can be connected to the TIM 4RD. The universally available global positioning system (GPS) is then used as a time source.

For setting up more complex control centers or node stations, several TIM 4RR/4RD modules can be used. Combinations with TIM 3V-IE Advanced, TIM 4R-IE and TIM 3 and other TIM 4 types are also possible.

SINAUT ST7 and thus also the TIM 4R/4RD are designed for data transmission via the widest range of WANs or combinations of WANs. Mixed classical SINAUT WANs (dedicated line, wireless, dial-up network) can be configured uniformly using SINAUT which saves both time and money.

■ Integration

Connection to a conventional WAN

For the connection to a conventional WAN the TIM 4R or 4RD provides two floating RS232/RS485 interfaces, to which various data communication devices can be connected, depending on the application, such as:

- Dedicated line modem MD2 for point-to-point, point-to-multipoint or line connections
- Wireless devices from various manufacturers, also for private mobile radio using the time slot method
- Analog dial-up modem MD3 for the analog telephone network or point-to-point dedicated lines
- GSM modem MD720-3 for access to the mobile radio network

Configuration examples with TIM 4R and TIM 4RD

Use in a node station

In a node station with a SIMATIC S7-400 the TIM 4R is connected to the S7-400 via its MPI and communicates, for example, by radio with the subordinate stations via one of the two RS232/RS485 interfaces. It is then connected to the control center via the second RS232/RS485 interface, e.g. via a dedicated line that is connected via an MD2 modem.

In a second node station. the TIM 4R is equipped in an S7-300 controller and also communicates via a radio network with the subordinate stations and with the control center by means of the dedicated line.

If one or both radio networks use the time slot procedure, a TIM 4RD with DCF77 radio clock receiver would have to be used instead of the TIM 4R, so that the time slot allocated in each case can be adhered to exactly.

In this configuration, data can be exchanged between all of the SINAUT stations regardless of which network they are situated in.

Redundant transmission paths

The TIM 4R can be used in the same way as the TIM 4R-IE for redundant transmission paths. The possible options are, however, restricted to the use of the serial interfaces of the TIM 4R and thus to the combination of conventional WAN connections.

Use in a control center

The TIM 4R is also suitable for use in a control center, either alone or in combination with other TIMs. In this way, for example, one TIM 4RD and one TIM 4R, which are both connected via their multipoint interface (MPI) with the control center PC (e.g. ST7cc), can be used. S7 controllers, which likewise exchange data with the SINAUT stations, can also be connected to the MPI bus - e.g. for controlling a dummy circuit diagram.

All conventional WANs such as dedicated-line, wireless or dial-up networks can be connected via the two RS232/RS485 interfaces of the TIM 4R or the TIM 4RD.

As the TIM 4RD has a built-in DCF77 radio clock receiver, it can provide the control system and all substations with the date and time. Wireless networks connected directly to this TIM can also be operated with the time slot procedure.

9

■ **Technical specifications**

Product type designation	TIM 4R / TIM 4RD
Transfer rate	50 to 38,400 bits/s
Interfaces	
• 1. Connection for external data transmission device	1 x 9-pin Sub D connector, RS232 can be switched to RS485
• 2. Connection for external data transmission device	1x RJ45; conversion to 9-pin Sub D connector is possible over the interface adapter cable supplied, RS232 can be switched to RS485
• MPI bus	1 x 9-pin Sub D socket
• DCF77 antenna (TIM 4RD)	1 x BNC socket (via supplied DCF77 adapter cable)
• Connection for supply voltage	1 x 4-pin terminal block
Cable length	
• RS232	max. 6 m
• RS485	max. 30 m
Supply voltage	24 VDC; min. 20.4 V, max. 28.8 V
Current consumption	
• from the backplane bus	60 mA (only if the TIM is used as a CP in an S7-300 rack)
• from 24 V DC	500 mA
Power loss	12.3 W
Permissible ambient conditions	
• Operating temperature	0 °C to +60 °C
• Transport/storage temperature	-40 °C to +70 °C
• Relative humidity	Max. 95 % at +25 °C
Design	
• Module format	Compact module S7-300, double width
• Dimensions (W x H x D) in mm	80 x 125 x 120
• Weight	Approx. 300 g
Degree of protection	IP 20
Configuration	
• Software for PG	SINAUT ST7 configuring software for PG
• Software for CPU	SINAUT TD7 function block library for CPU
• Storage of TIM configuration data	On internal TIM flash memory
TIM interfaces can be operated with this function	
• Terminal	Yes
• Node terminal	Yes
• Control center	Yes

Product type designation	TIM 4R / TIM 4RD
Number of TIM 4Rs per S7 CPU	More than one; number depends on the connection resources of the S7 CPU
Local communication in the rack of an S7-300	
• Via backplane bus with local S7-300 CPU	Yes, over TD7onCPU [1]
• Via backplane bus with further local TIMs	Yes
• Via MPI port of local S7-300 CPU [2] with further CPUs and/or PCs	Yes, through TD7onCPU (for S7-300 and S7-400) and S7 communication (for ST7cc/ST7sc)
Special communication in stand-alone mode	
• Via MPI port of the TIM with CPUs and/or PCs	Yes, through TD7onCPU (for S7-300 and S7-400) and S7 communication (for ST7cc/ST7sc)
User memory required in S7 CPU	Minimum 20 KB, actual requirement determined by data volume and functional scope
Message memory on TIM	about 10,000 message frames
Transmission protocols	
Available protocols	SINAUT ST7 SINAUT ST1
Operating mode for dedicated line/ radio network

		Indirect lightning protection For GPS outdoor antenna	6NH9 831-8LA
		SITOP compact 24 V/ 0.6 A 1-phase power supply with wide-range input 85 … 264 V AC/ 110 … 300 V DC, stabilized output voltage 24 V, rated output current value 0.6 A, slim design	6EP1 331-5BA00

9

Overview

- SINAUT communications module TIM with four interfaces for SIMATIC S7-300 or as self-contained unit for the S7-400 for use in the wide area network (WAN)
- For universal use in a SINAUT station, node station and control center
- Internet communication via integrated MSC-VPN tunnel with direct connection to DSL router or operation via IPsec VPN with additional SIMATIC NET components
- Wireless communication via GPRS router, GPRS modem, or radio devices
- Wired communication via Ethernet, DSL, dialup modems or dedicated line modem
- Complete migration of existing wireless, dedicated line and dial-up technology to IP-based network
- Message frame memory for complete recording of data and support of redundant communication paths
- Simple configuration and operation without specialist IT knowledge

Benefits

get Designed for Industry

- Protection of investment by combining existing conventional networks with IP-based networks by means of flexible options for connection of up to four SINAUT networks
- Low-cost construction of the control center by direct connection as independent device to a DSL router, made possible by the integrated MSC-VPN protocol
- No additional mobile phone service for fixed IP addresses or contracts for private GPRS networks with bidirectional data traffic are necessary, as the VPN is integrated in the ST7 system. No more expensive and complex VPN configuration by IT specialists.
- High availability of the connections due to possible redundant design of the communication paths
- Reliable storage of important data. Storage of data message frames (approx. 56,000) including time stamp on TIM in the case of communication path malfunction or power failure
- Saving of time and money through fast and user-friendly configuration of the connections, as well as through remote programming and diagnostics (PG routing) parallel to the SINAUT data transmission via the WAN or Internet connection
- Easy maintenance through replacement of modules without PG

Application

- Use as self-contained central station for the low-cost automation of water/wastewater networks with both complex and simple structures
- Control and monitoring of energy distribution systems and supply stations, such as oil, gas or district heating networks
- Preventive maintenance (condition monitoring) of globally distributed systems
- Monitoring of logistics and traffic control systems
- Connection of plants with basic or high-level security and availability requirements
- Use in hybrid networks with dialup, wireless, Ethernet or Internet communication

Design

The TIM 4R-IE offers all the advantages of the SIMATIC S7-300 design:

- Compact construction; double standard width of SIMATIC S7-300 SM modules
- Two 9-pin Sub-D connectors with a combined RS 232/RS 485 interface for connection to a conventional WAN via an appropriate modem
- Two RJ45 sockets for connecting to Industrial Ethernet or a IP-based network; designed for industry with additional fixing collars for connecting the IE FC RJ45 Plug 180
- 2-pin plug-in terminal strip for connection of the 24 V DC external supply voltage
- Front LEDs for indicating the module status and the communication
- Easy to mount; the TIM is mounted to an S7-300-mounting rail; if integrated as a CP into an S7-300 it is connected to adjacent modules by means of the bus connector supplied with the TIM. No slot rules apply. As a standalone device, it is linked via one of its Ethernet interfaces with one or more S7-400 CPUs or with one or more control center PCs.
- Can be operated in the expansion rack (ER) in conjunction with the IM 360/361
- Can be operated without a fan
- A battery backup or memory module can be fitted as an option

9

Function

The TIM 4R-IE can be used as a standalone device, i.e. it is fully functional even without S7-300-CPU. In this stand-alone mode, the TIM is especially suitable as a SINAUT communications processor for the control desk PC (e.g. SINAUT ST7cc or ST7sc) or for a SIMATIC S7-400. The TIM is connected to the PC or S7-400 via one of its two Ethernet interfaces. If the control desk is redundantly designed or if an S7-400 is additionally available there as a higher-level controller, then the TIM performs the SINAUT communication with the stations for all these devices connected to the local Ethernet.

The TIM 4R-IE can also be built into a SIMATIC S7-300 as a CP, e.g. if these devices require redundant transmission paths there or function as node stations at which more than two networks must be merged.

All the devices mentioned can exchange data with other SINAUT ST7 or ST1 partners with the aid of the TIM 4R-IE and specifically via as many as four SINAUT networks that can also be operated in any redundant combination.

The important SINAUT property - saving data complete with a time stamp on the TIM in the event of an interrupted link or failure of the partner - is then available not only for conventional WANs, but also for IP-based networks. Important events, alarms, etc. are not lost and the integrity of information in control center system archives is assured. Additional security is offered by the optional backup battery of the TIM 4R-IE which prevents the loss of saved data message frames if the 24 V supply fails.

For setting up more complex control centers or node stations, several TIM 4R-IE modules can be used. Combinations with TIM 3V-IE Advanced and TIM 3 and other TIM 4 versions are also possible.

As a communication module for the control desk PC, the TIM reduces the number of S7 connections that the PC would otherwise have to maintain when directly linked to the stations via an IP-based network, to just one (1) connection. In addition, the TIM then separates the local Ethernet from the IP-based network to the stations. Only SINAUT and PG communication with the stations is allowed through. This prevents unnecessary traffic in the WAN which is often not broadband.

A TIM 4R-IE that is used at a redundant control desk reduces the data volume in a WAN and thus it reduces the costs for networks with volume tariffs, e.g. GPRS. If stations were connected directly to the redundant control desk (without central TIM 4R-IE), they would send each message frame twice in order to send data to both control desk PCs. In the case of a control center TIM 4R-IE, the stations only send their message frames once. The doubling of the message frames for supplying both PCs is then performed by the control center TIM 4R-IE.

For data transmission via conventional WANs, the TIM 4R-IE has other, special properties that predetermine its use as a "control center" TIM.

SINAUT ST7 and thus also the TIM 4R-IE are designed for data transmission via the widest range of WANs or combinations of WANs. Mixed networks comprising classical SINAUT WAN networks (dedicated line, wireless, dial-up network) and IP-based networks (fiber optic, DSL, GPRS, Internet etc.) can be configured uniformly using SINAUT, which saves both time and money.

For communication via the Internet, the integrated MSC-VPN tunnel protocol for direct access to DSL routers can be used. The TIM 4R-IE can operate here as an MSC server or MSC client. For communication via GPRS, either the router MD741-1 can be connected to the Industrial Ethernet interface (VPN IPsec) or the GSM/GPRS modem MD720-3 (MSC-VPN) to the RS232 interface.

- The TIM4R-IE has four interfaces for simple and redundant transmission paths:
  - Two combined RS232/RS485 interfaces for connection to standard WANs such as dedicated line, wireless or dial-up network
  - Two RJ45 interfaces for connection to IP-based networks (WAN or LAN) such as fiber-optics, DSL, GPRS, etc.
- Compact, double-width module that can be used in a wide variety of situations:
  - The TIM handles the SINAUT communication for one or more S7-400 controllers or control desk PCs (SINAUT ST7cc or ST7sc) as a stand-alone device (stand-alone without S7-300 CPU); the connection in this case is via Ethernet interfaces of the TIM
  - As a communications processor (CP) in an S7-300
- The two RJ45 interfaces can be configured either as an MSC-VPN server in the central office or as MSC-VPN client in a station. At the RS232 interface, an MD720-3 can be operated in GPRS mode as MSC-VPN client.
- The four transmission paths can all be different and operated independently of one another, but also in any redundant combination.
- Flexible creation of redundant transmission paths via two conventional WANs, via two IP-based networks or a combination of WAN + IP-based network.
- When installed as a CP in an S7-300, the following communication is also possible via the backplane bus:
  - With the CPU
  - Via the MPI of this CPU with other CPUs and control desk PCs (ST7cc, ST7sc) connected over the MPI bus.
  - With other TIMs in this rack
- Message frame memory for up to 56,000 data message frames
- Optional backup battery for backup of the stored data message frames and the hardware clock if the power fails
- Up to 62 S7 connections or 128 MSC-VPN tunnel connections (as control center) via IP-based networks and MPI (for S7-300-CPU)
- The SINAUT TD7 software for the CPU (TD7 on CPU) is integrated in the TIM (TD7onTIM); implemented with installation as CP in a S7-300
- Module replacement possible without PG
  - In stand-alone mode using the optional C-PLUG
  - When installed as a CP in an S7-300 over the memory card of the CPU
- PG communication is possible parallel to data communication at any time
- Several TIM 4R-IE can be used per S7-300, also together with one or more TIM 3V-IE Advanced
- Up to 128 S7 connections via IP-based networks (in MSC tunnel mode)

9

■ Function (continued)

Controllable communication modules:

- Control of the GSM/GPRS modems MD720-3 in the GSM or GPRS mode. In GPRS mode, simple 128-bit encryption via the MD720-3 (MSC-VPN tunnel protocol).
- Operation via SIMATIC NET Ethernet components with high IPsec security standard (e.g. GPRS router or SCALANCE S)
- Direct operation on a DSL router by means of MSC tunnel protocol
- Use of SCALANCE fiber-optic switches for spanning long distances
- Wireless transmission via IWLAN with SCALANCE W over medium distances
- Dedicated line modem MD2 for point-to-point, point-to-multipoint or line connections
- Wireless devices from various manufacturers, also for private mobile radio using the time slot method
- Analog dial-up modem MD3 for the analog telephone network or point-to-point dedicated lines

Special properties as "control center" TIM

For data transmission via conventional WANs, the TIM 4R-IE has other, special properties that predetermine its use as a "control center" TIM:

- In a dialup network the message "Failure of local node" can be switched off. If the control desk PC fails or is temporarily shut down, the control center TIM 4R-IE will not send any failure message to the stations in the dialup network and therefore saves transmission costs.
- One especially useful feature during commissioning is the possibility that SINAUT stations can be switched on and off on the control center TIM 4R-IE. This applies not only for stations that are connected via dedicated line/radio, but also for stations in the dial-up network. The last status set for each station is permanently stored on the TIM and is therefore not lost if the power fails or the TIM is restarted.
- For GPRS, dedicated lines and mobile networks, the message "Node faulty" can be suppressed on the TIM 4R-IE for a programmable period of time. A station failure is then no longer indicated after x unanswered calls (polls), but only when a recognized fault still exists after expiry of the programmed time. This enables the number of failure messages to be reduced in poor-quality networks and it also minimizes the additional message frame traffic that must be processed after each station is restored.

Optional C-PLUG

The most frequent application for the TIM 4R-IE will be its use as a communication module for the control desk PC or for an S7-400. The TIM then operates in standalone mode, i.e. without S7-300 CPU. The option of saving the TIM configuration data on the MMC card of the CPU, in order to exchange the TIM without a PG in the event of a fault, no longer applies. The saving of configuration data on the C-PLUG, which can be optionally equipped, solves this problem. This means that, even in standalone mode, a replacement of the TIM is possible without PG.

■ Integration

Connection to IP-based networks

In addition to the two combined RS232/RS485 interfaces, the TIM 4R-IE also has two RJ45 sockets. These are suitable for the connection of IP-based networks (WAN or LAN). Depending on the application, various types of data communication equipment can be connected such as:

- SCALANCE X switches for Twisted Pair cable or fiber-optic cables
- SCALANCE W (IWLAN) and Ethernet radio devices from various manufacturers
- SCALANCE M873/875 for UMTS communication via mobile telephone networks
- EGPRS router MD741-1 for GPRS communication and EGPRS (Edge) over mobile telephone networks
- DSL router in combination with SCALANCE S for VPN (IPsec)
- GPRS/GSM modem MD720-3 for GPRS communication via GSM mobile telephone networks using MSC-VPN tunnel protocol
- Directly on a DSL router by means of the MSC-VPN tunnel protocol integrated in the TIM
- Broadband systems such as OTN, PCM30

Connection to a conventional WAN

For the connection to a conventional WAN the TIM 4R-IE provides two floating RS232/RS485 interfaces, to which various data communication devices can be connected, depending on the application, such as:

- Dedicated line modem MD2 for point-to-point, point-to-multipoint or line connections
- Wireless devices from various manufacturers, also for private mobile radio using the time slot method
- Analog dial-up modem MD3 for the analog telephone network or point-to-point dedicated lines
- GPRS/GSM modem MD720-3 for access to the mobile telephone network

Industrial Remote Communication
TeleControl Professional – Substations for ST7 protocol

TIM 4R-IE for WAN and Ethernet

■ **Integration** (continued)

Configuration examples using TIM 4R-IE

Use in a node station

In a node station with a SIMATIC S7-400 the TIM 4R-IE is connected to the S7-400 via one of its two Ethernet interfaces and can, for example, exchange data by radio with the subordinate stations via an RS232/RS485 interface. It is then connected to the control center via the second Ethernet interface, e.g. via a fiber-optic cable that is connected through SCALANCE X switches and media converters.

In this configuration, data can be exchanged between all of the SINAUT stations regardless of which network they are situated in.

Redundant transmission paths

Using TIM 4R-IE, a station can be connected to the control center over redundant paths. The TIM 4R-IE is used for this purpose both in the station and in the control center. The example shows as redundant paths a combination of leased line and radio, i.e. two conventional WANs, for which the TIM 4R-IE offers corresponding connections (2 x RS232/RS485). The two TIMs coordinate the data transmission. It takes place normally over the main path and only if it fails over the standby path. When the main path is restored, changeover back to this path is performed automatically.

Integration (continued)

Use in a control center

The TIM 4R-IE is also suitable for use in a control center, either alone or in combination with other TIMs. The following example shows a TIM 4R-IE that is connected via one of its two Ethernet interfaces with the control center PC (e.g. ST7cc). An S7-400 is also connected to the Industrial Ethernet and this must also exchange data with the SINAUT stations. SINAUT stations are connected by means of GPRS using MSC-VPN via the second Ethernet port of the TIM, while a wireless network and point-to-point leased line network are connected via the two RS232/RS485 ports. For the point-to-point connection, the port of the

TIM is set to RS485. It is then possible to operate up to 30 SINAUT leased line modems on this port; the example shows MD2 modems.

If the stations in this network have to be provided with the date and time, the control center PC assumes the function of the clock-time master. Via the Ethernet connection, the TIM 4R-IE is regularly synchronized by the PC and it then takes over the synchronization of the connected stations.

Overview

- SINAUT communication module SIPLUS TIM with four interfaces for SIMATIC S7-300 or as self-contained unit for the S7-400 for use in a wide area network (WAN)
- For universal use in a SINAUT station, node station and control center
- Internet communication via integrated MSC-VPN tunnel with direct connection to DSL router or operation via IPsec VPN with additional SIMATIC NET components
- Wireless communication via GPRS router, GPRS modem, or radio devices
- Wired communication via Ethernet, DSL, dialup modems or dedicated line modem
- Complete migration of existing wireless, dedicated line and dial-up technology to IP-based network
- Message frame memory for seamless recording of data and support of redundant communication paths
- Simple configuration and operation without specialist IT knowledge

Note:

SIPLUS extreme products are based on Siemens Industry standard products. The contents listed here were taken from the respective standard products. SIPLUS extreme-specific information was added.

SIPLUS TIM 4R-IE	
Order number	**6AG1 800-4BA00-7AA0**
Order No. based on	**6NH7 800-4BA00**
Ambient temperature range	-25 ... +70 °C
Conformal coating	Coating of the printed circuit boards and the electronic components
Technical data	The technical data of the standard product applies except for the ambient conditions.
Ambient conditions	
Relative humidity	5 ... 100 % Condensation permissible
Biologically active substances	Conformity with EN 60721-3-3, Class 3B2 mold and fungal spores (except fauna)
Chemically active substances	Conformity with EN 60721-3-3, Class 3C4 incl. salt mist and ISA–S71.04 severity level G1; G2; G3; GX [1] [2]
Mechanically active substances	Conformity with EN 60721-3-3, Class 3S4 including conductive sand, dust [2]
Air pressure (depending on the highest positive temperature range specified)	1080 ... 795 hPa (-1000 ... +2000 m) see ambient temperature range
	795 ... 658 hPa (+2000 ... +3500 m) derating 10 K
	658 ... 540 hPa (+3500 ... +5000 m) derating 20 K

[1] ISA-S71.04 severity level GX: Long-term load: $SO_2 < 4.8$ ppm; $H_2S < 9.9$ ppm; $Cl < 0.2$ ppm; $HCl < 0.66$ ppm; $HF < 0.12$ ppm; $NH < 49$ ppm; $O_3 < 0.1$ ppm; $NOX < 5.2$ ppm
Limit value (max. 30 min/d): $SO_2 < 17.8$ ppm; $H_2S < 49.7$ ppm; $Cl < 1.0$ ppm; $HCl < 3.3$ ppm; $HF < 2.4$ ppm; $NH < 247$ ppm; $O_3 < 1.0$ ppm; $NOX < 10.4$ ppm

[2] The supplied plug covers must remain in place over the unused interface when operated in atmospheres containing corrosive gases!

Introduction

■ **Overview**

The TIM telecontrol communication module

TIM 3V-IE DNP3

The TIM 3V-IE DNP3 (DNP3 protocol) is a SINAUT communications module for the telecontrol substation with SIMATIC S7-300. It has an RS232 interface to which a suitable external dedicated line modem or wireless modem can be connected. It additionally possesses an RJ45 interface, which permits communication over IP-based networks. On the TIM 3V-IE DNP3, both interfaces can be operated simultaneously, e.g. to implement path redundancy to a DNP3 control center.

TIM 4R-IE DNP3

The TIM 4R-IE DNP3 (DNP3 protocol) has two RS232/RS485 interfaces for data transmission via conventional WANs (copper dedicated line, wireless) and additionally two RJ45 interfaces for connection to IP-based networks (WAN or LAN).

This TIM can be used as a communication processor in a SIMATIC S7-300, but it is especially suitable as a telecontrol module for a SIMATIC S7-400 or SIMATIC S7-400H. In this case it is connected to the S7-CPU as stand-alone device via one of its two Ethernet interfaces. The module can only be configured as a station module, but as such it can also be connected via Ethernet direct to a PC as the DNP3 control center.

The four transmission paths can all be different and operated independently of one another, but also in any redundant combination.

■ **Design**

Configuration examples

S7-300 or S7-400 substations can be connected to a WAN via the isolated serial interfaces of the TIM DNP3 modules, and specifically via different data communication devices depending on the application:

- Dedicated line modems for point-to-point, point-to-multipoint or line connections
- Fiber-optic cable modules (via RS485 converters)
- Wireless devices from various manufacturers

The S7-300 or S7-400 substations can be connected to Ethernet, i.e. to IP-based networks (LAN, IWLAN, DSL, GPRS, etc.) via the RJ45 interfaces of the TM DNP3 modules.

Configuration example in classic WAN

Use in a station with transmission via a dedicated line network

The connection to the control center, e.g. with SIMATIC PCS 7 TeleControl, is implemented via the MD2 modem, which sets up the connection via a dedicated line.

Configuration example in classic WAN

Overview

In an S7 station, the communications module TIM 3V-IE DNP3 (**T**elecontrol **I**nterface **M**odule) processes the data traffic for the S7-CPU to the assigned master system SIMATIC PCS7 TeleControl V7.1 SP2 using the open protocol DNP3 (**D**istributed **N**etwork **P**rotocol).

- with the S7-300 housing, can be fully integrated into the S7-300 system
- RS232 port for connecting an external modem for data transmission via a conventional WAN
- RJ45 port for data transmission via IP-based networks

Benefits

g e t **get** Designed for Industry

- Flexible option for connection to any conventional or IP-based WAN
- Connection to DNP3 master systems from third-party vendors is possible by using the open protocol DNP3
- Saving of traveling and maintenance costs due to cost-effective remote programming, diagnostics, control and monitoring via the Internet
- Reduction in time and costs thanks to quick and user-friendly configuration of connections and data to be transferred with the SINAUT configuration software and block library
- Reliable back-up of important data:
  Storage of the DNP3 data points (max. 50,000 in the case of a master), including time stamp on the TIM if the communication path is faulty or a partner has failed

Application

- Low-cost automation of water/wastewater networks with both complex and simple structures
- Control and monitoring of energy distribution systems and supply stations, such as oil, gas or district heating networks
- Preventive maintenance (condition monitoring) of globally distributed systems
- Connection of plants with basic or high-level security and availability requirements
- Use in hybrid networks with dial-up, wireless, Ethernet or Internet communications

Design

The TIM 3V-IE DNP3 offers all the advantages of the SIMATIC S7-300 design:

- Compact design with S7-300 format
- 9-pin sub-D connectors with an RS232 interface for connection to a conventional WAN via an appropriate modem
- RJ45 socket for connection to Industrial Ethernet or an IP-based network;
  industrial design with additional retaining collar, for connecting the IE FC RJ45 Plug 180
- 2-pin plug-in terminal strip for connection of the 24 V DC external supply voltage
- Front-panel LEDs for indicating the module status and the communication
- Easy installation;
  the TIM 3V-IE DNP3 is mounted on the DIN rail of the S7-300 and connected to adjacent modules by means of the bus connector supplied with the TIM. No slot rules apply.
- Can be operated in the expansion rack (ER) in conjunction with the IM 360/361 interface modules
- Can be operated without a fan
- No backup battery or memory module is required

9

Industrial Remote Communication
TeleControl Professional – Substations for DNP3 protocol

TIM 3V-IE DNP3

Function

- Data transmission over the open protocol DNP3
- Extensive diagnostic functions with the option of logging the transmitted and received frames
- Time-of-day synchronization with the assigned DNP3 master system
- Remote programming in the case of IP-based networks

The TIM 3V-IE DNP3 communications module has its own processor and a RAM for buffering up to 50,000 data points. This prevents any loss of data in the event of a fault on the communication link or the failure of a communication partner.

Diagnostics

The SINAUT diagnostics and service tool of the SINAUT ST7 Engineering Software V5.1 provides comprehensive diagnostic functions, including:

- Operating status of the TIM module
- Module status of the TIM module
- General diagnostic information
- Diagnostic buffer of the TIM module
- Status of the connections to remote communication partners (e.g. SIMATIC PCS7 TeleControl V7.1 SP2)
- Status and level of the transmit buffer
- TIM frame monitor for recording the frame traffic

Configuration

The SINAUT ST7 engineering software V5.1 is used for configuring the TIM 3V-IE DNP3 module. Parameters are assigned with the aid of the SINAUT configuration software in STEP 7 HW Config and STEP 7 Netpro.

Integration

By means of a floating RS232 interface, the TIM 3V-IE DNP3 module is connected to a WAN, and specifically via various data communication devices depending on the application:

- Dedicated line modems for point-to-point, point-to-multipoint or line connections
- Fiber-optic cable modules (via RS485 converters)
- Wireless devices from various manufacturers

Via the RJ45 interface, the TM 3V-IE DNP3 module can be connected to the Ethernet, i.e. to IP-based networks (LAN, IWLAN, DSL, GPRS, UMTS, etc.).

Configuration examples in conventional and IP-based WAN

Use in a station with transmission via a dedicated line network

The connection to the master station is via the MD2 modem, which sets up the connection via a dedicated line.

■ **Integration** (continued)

Use in a station with transmission via Internet	Use in a station with transmission over the GSM mobile telephone service GPRS or UMTS
The stations are connected by means of an Internet connection. In this case, DSL routers must be used in the station and control center – preferably in combination with SCALANCE S in order to establish secure connections using VPN tunnels.	The stations are connected via the GSM mobile telephone service GPRS. In this case the GPRS router MD741-1 is used in the station and a SCALANCE S security module is used in the control center which ensures that the VPN connections are set up with the GPRS stations.
	For higher data rates, in place of the GRPS router MD741-1, the UMTS Router SCALANCE M875 can be implemented for use of the UMTS mobile radio network.

Industrial Remote Communication
TeleControl Professional – Substations for DNP3 protocol

TIM 4R-IE DNP3

Overview

In an S7 station, the communication module TIM 4R-IE DNP3 (**T**elecontrol **I**nterface **M**odule) processes the data traffic for the S7-CPU to the assigned master system SIMATIC PCS7 TeleControl V7.1 SP2 using the open protocol DNP3 (**D**istributed **N**etwork **P**rotocol).

- With the double-width S7-300 housing, can be fully integrated into the S7-300 system
- Can be connected as a stand-alone to a SIMATIC S7-400 and SIMATIC S7-400 H System
- Two RS232/RS485 interfaces for the connection of an external modem for data transmission via a conventional WAN
- Two RJ45 interfaces for data transmission via IP-based networks
- By the use of physically separate connection paths, the module permits media redundancy without loss of data during the switchover

Benefits

- High plant availability by means of end-to-end redundancy
- Connection to DNP3 master systems from third-party vendors is possible by using the open protocol DNP3
- Saving of traveling and maintenance costs due to cost-effective remote programming, diagnostics, control and monitoring via the Internet
- Reduction in time and costs thanks to quick and user-friendly configuration of connections and data to be transferred with the SINAUT configuration software and block library
- Reliable back-up of important data; Storage of the DNP3 data points (max. 200,000 in the case of a master), including time stamp on the TIM if the communication path is faulty or a partner has failed

Application

- Low-cost automation of water/wastewater networks with both complex and simple structures
- Control and monitoring of energy distribution systems and supply stations, such as oil, gas or district heating networks
- Preventive maintenance (condition monitoring) of globally distributed systems
- Connection of plants with basic or high-level security and availability requirements
- Use in hybrid networks with wireless, Ethernet or Internet communication

Design

The TIM 4R-IE DNP3 offers all the advantages of the SIMATIC S7-300 design:

- Compact design with double-width S7-300 format
- Two 9-pin sub-D connectors with a combined RS232/RS485 interface for connection to a conventional WAN via an appropriate modem
- Two RJ45 sockets for connection to Industrial Ethernet or an IP-based network; industrial design with additional retaining collar, for connecting the IE FC RJ45 Plug 180
- 2-pin plug-in terminal strip for connection of the 24 V DC external supply voltage
- Front-panel LEDs for indicating the module status and the communication
- Easy installation; the TIM 4R-IE DNP3 is mounted on the DIN rail of the S7-300 and connected to adjacent modules by means of the bus connector supplied with the TIM. No slot rules apply. For connection of an S7-400 station, it is linked as a stand-alone device via one of its Ethernet ports with one or more S7-400 CPUs.
- Can be operated in the expansion rack (ER) in conjunction with the IM 360/361 interface modules
- Can be operated without a fan
- A backup battery and a memory module (C-PLUG) can be installed as options

9

■ **Function**

- Data transmission over the open protocol DNP3
- Media redundancy by the use of physically separated connection paths without the loss of data when switching over
- Extensive diagnostic functions with the option of logging the transmitted and received frames
- Time-of-day synchronization with the assigned DNP3 master system
- Remote programming in the case of IP-based networks
- Option for connecting a SIMATIC S7-400 and SIMATIC S7-400 H system

The communications module TIM 4R-IE DNP3 has its own processor and a RAM for buffering up to 200,000 data points. This prevents any loss of data in the event of a fault on the communication link or the failure of a communication partner.

Diagnostics

The SINAUT diagnostics and service tool of the SINAUT ST7 Engineering Software V5.1 provides comprehensive diagnostic functions, including:

- Operating status of the TIM module
- Module status of the TIM module
- General diagnostic information
- Diagnostic buffer of the TIM module
- Status of the connections to remote communication partners (e.g. SIMATIC PCS7 TeleControl V7.1 SP2)
- Status and level of the transmit buffer
- TIM frame monitor for recording the frame traffic

Configuration

The SINAUT configuration software V5.1 is used for configuring the TIM 4R-IE DNP3 module. Parameters are assigned with the aid of the SINAUT configuration software in STEP 7 HW Config and STEP 7 Netpro.

■ **Integration**

The TIM 4R-IE DNP3 module is connected to a WAN via two floating RS232/RS485 interfaces, and specifically via various data communication devices depending on the application:

- Dedicated line modems for point-to-point, point-to-multipoint or line connections
- Fiber-optic cable modules (via RS485 converters)
- Wireless devices from various manufacturers

Via two RJ45 interfaces, the TIM 4R-IE DNP3 module can be connected to the Ethernet, i.e. to IP-based networks (LAN, IWLAN, DSL, GPRS, UMTS, etc.).

Configuration examples in conventional and IP-based WAN

Use in a station with transmission via a dedicated line network

The connection to the master station is via the MD2 modem, which sets up the connection via a dedicated line.

Use in a station with transmission via Internet

The stations are connected by means of an Internet connection. In this case, DSL routers must be used in the station and control center – preferably in combination with SCALANCE S in order to establish secure connections using VPN tunnels.

9

Industrial Remote Communication
TeleControl Professional – Substations for DNP3 protocol

TIM 4R-IE DNP3

■ **Integration** (continued)

Use in a station with transmission over the GSM mobile telephone service GPRS or UMTS

The stations are connected via the GSM mobile telephone service GPRS. In this case the GPRS router MD741-1 is used in the station and a SCALANCE S security module is used in the control center which ensures that the VPN connections are set up with the GPRS stations.

For higher data rates, in place of the GRPS router MD741-1, the UMTS Router SCALANCE M875 can be implemented for use of the UMTS mobile radio network.

Use in a station with path redundancy

The connection of the stations with a TIM 4R-IE DNP3 enables redundant connection paths to be set up. On the failure of the active connection (e.g. the Internet connection) a switch is made to the second connection path (e.g. WAN).

■ Overview

IEC 60870-5-101, -103, -104 are standardized vendor-independent protocols. With SIPLUS RIC, they can be parameterized with SIMATIC Manager without the need for additional installations.

SIMATIC Controllers can also communicate with third-party products by means of the IEC protocols.

The SIPLUS RIC bundles usually comprise

- CPU
- Interface/communication module (if necessary)
- Memory Card
- CD with library and registration code.

SIPLUS RIC products require additional material to establish telecommunication links, e.g. TCP/IP converters – serial, dedicated line modems, media converters, TCP/IP routers, SCALANCE S security modules, switches, cables, etc.

In order to implement telecontrol networks, basic topologies including point-to-point, multi-point, star and ring can be configured using classic or TCP/IP-based media. These can be combined flexibly independent from existing infrastructure.

**Classic WAN media
(IEC 870-5-101 telecontrol protocol)**
- Dedicated line via modem, e.g. SINAUT MD2
- Dedicated line over fiber-optic cables
- Private wireless networks

**TCP/IP-based WAN media
(IEC 870-5-104 telecontrol protocol)**
- Ethernet networks, e.g. SCALANCE X with fiber-optic cables
- Industrial Wireless LAN with SCALANCE W
- Public networks and the Internet using DSL and/or GPRS/UMTS
- Satellite communication, e.g. with Inmarsat

IEC 870-5-104 – example of TCP/IP-based WAN with GPRS radio network (star topology)

Industrial Remote Communication
TeleControl Professional – Substations for IEC protocol

SIPLUS RIC bundles for IEC 60870-5-101

Overview

With SIPLUS RIC, existing installations can be modernised and expanded with IEC protocols.

The IEC 60870-5-101 protocol is an international standard for telecontrol and has been approved by the International Electrotechnical Commission (IEC). It enables devices and equipment for telecontrol and substation automation technology from different manufacturers to communicate with each other. It is an asynchronous protocol for serial transmission (V.24/V.28, V.11).

The interaction between devices from different manufacturers is assured by an interoperability list. The profiles of the message types and functions used are matched to each other here.

The great advantage of the IEC 60870-5-101 protocol is its ruggedness in the data link layer (hamming distance 4) and the simple structure of the application layer.

Industrial Remote Communication
TeleControl Professional – Substations for IEC protocol

SIPLUS RIC bundles for IEC 60870-5-103

Overview

The IEC 60870-5-103 protocol is an international standard and was approved by the International Electrotechnical Commission (IEC) in the 1990's. The protocol controls communication between one central unit and several protection devices.
IEC 60870-5-103 is mainly used for asynchronous connections (V.24/V.28, RS232 or RS485). The protocol offers expansions for proprietary manufacturer-specific functions, so that compatibility can only be ensured with the help of the interoperability list.

SIPLUS RIC IEC 60870-5-103 library

■ **Overview**

If a SIMATIC PCS 7 system or an RTU based on WinAC RTX is to communicate with a protection device via the protection device protocol IEC 60870 5, the protection device protocol IEC 60870 5 103 (serial) can be used in SIMATIC automation systems.

The add-on software enables two protocols to be implemented on one SIMATIC CPU. This makes it possible, for example, to communicate with the control center via IEC 60870 101 or 104 and simultaneously with a protection device via IEC 60870 5 103.

SIPLUS RIC bundles for IEC 60870-5-104

■ Overview

The IEC 60870-5-104 protocol defines the communication between the control center and substations for monitoring and controlling geographically distributed systems. The TCP/IP communication used takes place via IP-based networks (LAN/WAN). Interoperability between devices from different manufacturers is ensured for this protocol by an interoperability list.

Advantages of the TCP/IP-based connection are simultaneous data transfer through IEC 60870-5-104 to several devices and simultaneous diagnostics using SIMATIC Manager.

Security mechanisms are, however, not defined in the application area of IEC 60870-5-104. The encryption of user data (data integrity) and authentication of the communication partners are not incorporated in the IEC standard. Appropriate protective measures (see Industrial Security) must be implemented separately.

■ Overview

The IEC 60870-5-104 protocol defines the communication between the control center and substations by means of a TCP/IP connection for monitoring and controlling geographically distributed systems. Communication takes place via IP-based networks (LAN/WAN). Interoperability between devices from different manufacturers is ensured for this protocol by an inter-operability list.

A great advantage of the TCP/IP-based connection is the simultaneous data transfer through IEC 60870-5-104 to several devices and simultaneous diagnostics using SIMATIC Manager.

Security mechanisms are, however, not defined in the application area of IEC 60870-5-104. The encryption of user data (data integrity) and authentication of the communication partners are not incorporated in the IEC standard. Appropriate protective measures (see Industrial Security) must be implemented separately.

SIPLUS RIC IEC 60870-5-104 library

Overview

If a SIMATIC PCS 7 system or an RTU based on WinAC RTX is to communicate with a SIMATIC PCS 7 TeleControl center or a control center of a third-party supplier using the IEC 60870-5 telecontrol standard, the IEC 60870-5-104 (TCP/IP) telecontrol protocol can be used in the SIMATIC automation systems.

Advantages of the TCP/IP-based connection are simultaneous data transfer through IEC 60870-5-104 to several devices and simultaneous diagnostics using SIMATIC Manager.

Security mechanisms are not defined in the application area of IEC 60870 5-104. An encryption of user data (data integrity) and authentication of the communication partners are not incorporated in the IEC standard. Appropriate protective measures (see Industrial Security) must be implemented separately.

Overview

SINAUT MD3 modem

Modems are used for wired transmission of signals and data between individual stations and the control center of a telecontrol system. Siemens offers appropriate modems for both dedicated lines and dial-up networks.

Like the TIM modules, these are accommodated in an S7-300 enclosure:

- **MD2;**
  dedicated-line modem for multi-point connection,
  can be tapped,
  can also be used as a repeater,
  max. 19,200 bit/s

- **MD3;**
  modem for the analog telephone network,
  max. 33,600 bit/s;
  can also be used as a dedicated-line modem for a point-to-point connection,
  max. 33,600 bit/s in voice band

These modems can be connected to the serial modem interface of a TIM module.

The modems are supplied together with the WAN connecting cable required in each case. Connecting cables for connecting the modems to a TIM must be ordered separately.

Benefits

g e get Designed for Industry

- Diverse application options for use in dedicated-line networks or for conventional telephone networks (analog, ISDN, GSM)
- Matched to the telecontrol system by means of the design of the SIMATIC S7-300
- Electrical isolation between power supply and WAN interface

Application

The modems can be used in other applications as dedicated-line modems or dial-up modems independently of the SINAUT ST7 system.

Due to the design and the electrical properties, the modems are suited above all for applications in the industrial sector.

Design

All three modem types are identically designed and offer all the advantages of the SIMATIC S7-300 design:

- Compact construction;
  double standard width of SIMATIC S7-300 SM modules
- RJ12 socket for connecting the modem to the WAN (leased line or dialup network)
- 9-pin Sub-D connector with an RS232 interface for connection to the serial interface of a communication module, e.g. TIM
- 9-pin Sub-D socket with an RS 485 interface for connection to the serial interface of a communication module, e.g. TIM
- 4-pin plug-in terminal strip for connection of the 24 V DC external supply voltage
- Front-panel LEDs indicating TXD, RXD, DTR, RTS/ONL, CTS/RI and DCD
- Simple installation;
  on a mounting rail of the S7-300, or on a 35 mm standard rail
- The SINAUT ST7 modems can be operated without a fan

Industrial Remote Communication
Telecontrol network – Modems

Modems

■ **Design** (continued)

Configuration examples

An MDx modem is connected to a TIM by means of a standard connecting cable of type 7701. The modem is mounted on a separate S7-300 mounting rail or on a 35 mm standard mounting rail (an appropriate adapter is available).

In the following configuration, the modem is accommodated to the far right in the rack. The TIM is connected to the adjacent module by means of a bus connector. There is no bus connector between TIM and modem. This means that no S7 modules may be used immediately to the right of the modem.

In an S7-400 with TIM 4R-IE the TIM and modem are mounted together on a separate S7-300 mounting rail. The TIM is connected to the CPU by means of one of its Ethernet interfaces. The TIM and MDx modem are connected by means of a standard connecting cable of type 7701.

The next configuration shows the connection of a point-to-point dedicated line network to a TIM 4R-IE, which functions as a control center TIM, for example on the control center PC (e.g. SINAUT ST7cc or ST7sc). Each cable belonging to the point-to-point network is terminated with a modem in the control center. All these modems are connected by means of their RS485 interface to the RS232/RS485 interface of the TIM 4R-IE.

MD2 dedicated line modem

■ Overview

- Frequency-modulated (FSK) dedicated line modem;
- Half-duplex data transfer over 2-wire dedicated line, duplex data transfer over 4-wire dedicated line
- Thanks to the modem's relaying ability, lines with several connected stations can also be implemented. The MD2 can also be used as repeater on 2-wire and 4-wire dedicated lines.
- Private or leased telephone lines can be used as dedicated lines. The MD2 is also suitable for connection to a radio device with modem input.

■ Benefits

get Designed for Industry

- RS232 and RS485 interface
- Isolation between voltage supply and RS232/RS485 interface
- 4 different transmission rates to select
- Supports tandem stations
- Integrated double transformer for the connection of two 2-wire lines
- Integrated repeater function for multiplication of range
- Suitable for connection to a wireless device with modem input

■ Application

The MD2 modem can be used as a dedicated-line modem independently of the SINAUT ST7 system. Due to its design and the electrical properties, the MD2 is especially suited for use in the industrial sector.

Examples of use outside the SINAUT ST7 system:

- Extension of Profibus and MPI links;
  see FAQ 23671172 (for PB) or 23671640 (for MPI)
- As leased line modem for S7-200;
  see Micro Automation Set MAS 17

The MD2 enables distances of up to 33 km (at 1200 bit/s), 27 km (at 2400 bit/s) and up to 11 km (at 9600 and 19,200 bit/s) to be spanned without amplifiers/repeaters (guide values for uncoiled communication cable of type 2 x 2 x 0.8 J-Y(St)Y). By interconnecting two MD2 modems to a repeater, the specified distances can be extended several times.

The MD2 modem permits the construction of network structures in the "point-to-point", "star" or "linear" configurations, as well as combinations of these basic structures. If the modem is used in the control center, a small star network comprising two 2-wire cables can be connected at the modem output. By connecting several MD2s (max. 32) by means of their RS485 interfaces, the star network can be expanded to a multiple of 2 x 2-wire.

For the arrangement of an MD2 along a line, the modem output can be switched to high impedance. This reduces the insertion loss to a minimum and thus only marginally reduces the maximal bridgeable distance. The very short transmitter make-times ensure a prompt execution of the data traffic with the "polling" used in the dedicated line network.

Apart from private dedicated lines, the MD2 can also be connected to Telekom leased lines. Corresponding approval exists. In the case of exclusively analog leased lines, the transmission rates 1200 and 2400 bit/s are possible, whereas for analog/digital-converted leased lines the speed is usually limited to 1200 bit/s for technical reasons.

The MD2 is also ideal for data transmission via a walkie-talkie with modem input. In order to switch the walkie-talkie on and off via its PTT input, a floating optical relay is integrated in the MD2 modem that is linked with the RTS signal of the RS232 interface. The two connections of the optical relay are available on the RJ12 socket.

As walkie-talkies usually only transmit voice signals in the 300 to 3000 Hz frequency range, the transmission rate with the MD2 modem is limited here to 1200 bit/s. For 2400 bit/s, the frequency range would have to exceed 3300 Hz.

9

Industrial Remote Communication
Telecontrol network – Modems

MD2 dedicated line modem

■ Design

The MD2 modem offers all the advantages of the SIMATIC S7-300 design:

- Compact construction;
  double standard width of SIMATIC S7-300 SM modules

- RJ12 socket for connecting the modem to the dedicated line

- 9-pin Sub-D connector with an RS232 interface for connecting the modem to the RS232/RS485 interface of the TIM

- 9-pin Sub-D connector with an RS485 interface for connecting the modem to the RS232/RS485 interface of the TIM

- 4-pin plug-in terminal strip for connection of the 24 V DC external supply voltage

- Front-panel LEDs indicating TXD, RXD, DTR, RTS/ONL, CTS/RI and DCD

- Easy installation;
  the modem is mounted on an S7-300 mounting rail; alternatively, it can be mounted on a 35mm standard rail using the adapter 6NH7760-0AA0, available separately.

- The modem can be operated without a fan.

■ Integration

Various ways in which the MD2 modem can be connected to a TIM or other MD2 modems, as well as to the dedicated line (via an LTOP overvoltage protection module), are illustrated below.

Connection of an MD2 to a TIM via the RS232 interface

One MD2 modem can be connected to a TIM via the RS232 interface. This technique can be used to set up "point-to-point" and "line" network configurations as well as a small star network (only with TIM 4) with only two 2-wire lines.

Connection of several MD2s to a TIM via the RS485 interface

Several MD2 modems can be connected to a TIM 4 via the RS485 interface. This type of interconnection is used if a number of dedicated lines have to be combined on a single WAN port on the TIM, i.e. if a star topology is connected, as illustrated schematically below.

Calculating the maximum range (in km) based on transmission rate and wire diameter

The table below can be used to calculate approximate values for the maximum distance in km which can be covered by the MD2 modem, depending on transmission rate and wire diameter.

The values in the table are guide values for non-coil-loaded message lines type 2 x 2 x A J-Y(St)Y (A = core diameter in mm).

A level reserve of 4 dB was applied when calculating the maximum ranges. This should ensure that even in the event of deviations in cable characteristics, which experience has shown to be possible during operation, the level will always be sufficient to ensure fault-free data transmission.

9

MD2 dedicated line modem

MD2 dedicated line modem

■ **Technical specifications**

Dedicated line modem MD2	
Interfaces	
• Connection for dedicated line	1 x RJ12
• RS232 connection for data terminal equipment	1 x 9-pin Sub-D connector
• RS485 connection for data terminal equipment	1 x 9-pin Sub-D socket
• Connection for supply voltage	1 x 4-pin terminal block
Voltage supply	24 V DC
Current consumption	
• from 24 V DC	100 mA
Power loss	2.4 W
Permissible ambient conditions	
• Operating temperature	0 °C … +60 °C
• Transport/storage temperature	-40 °C … +70 °C
• Relative humidity	max. 95 % at +25 °C
Design	
• Module format	Compact module S7-300, double width
• Dimensions (W x H x D) in mm	80 x 125 x 120
• Weight	approx. 300 g
Degree of protection	IP20
Transmission path	2-wire, 2 x 2-wire or 4-wire, twisted pair cable, non-coil-loaded or lightly coil-loaded
Modulation method	Phase-continuous binary frequency modulation (FSK)
Data transmission rates via the dedicated line	1200 bit/s 2400 bit/s 9600 bit/s (not for leased telephone lines) 19200 bit/s (not for leased telephone lines)
Operating mode	
• 2-wire or 2 x 2-wire	Half-duplex
• 4-wire	Duplex or half-duplex

Dedicated line modem MD2	
Transmission level can be set to	0 dB -6 dB -9 dB (for leased telephone lines) -15 dB
Receiving level	0 … -43 dB
Adjustable terminating resistor	
• for 1200 and 2400 bit/s	600 ohms
• for 9600 and 19200 bit/s	150 ohms
• for tapping point	> 6 kOhms
Clear to send	
• at 1200 bit/s	after 7 ms
• at 2400 bit/s	after 4 ms
• at 9600 and 19200 bit/s	after 0.5 ms
Minimum/maximum scanning frequency	
• at 1200 bit/s	1300 Hz/2100 Hz
• at 2400 bit/s	2400 Hz/3300 Hz
• at 9600 and 19200 bit/s	20800 Hz/33600 Hz
Asynchronous character format	10 or 11 bit
Floating opto-relay output	
• Max. supply voltage	60 V AC/DC
• Max. perm. continuous current	400 mA
• Max. R_{on}	3 ohms
Impulse strength $U_{1.2/50}$ acc. to DIN VDE 0804 between power supply circuit and	
• Power supply circuit and FSK trunk line circuits	2.5 kV
• Power supply circuit and opto-relay output	2.5 kV
Compatible with SINAUT modems	
• MD100	at 1200 bit/s
• MD124	at 1200, 2400 and 19200 bit/s
Approvals	EU approval CE 0682 X

Industrial Remote Communication
Telecontrol network – Modems

MD3 telephone modem

Overview

- Dial-up modem for data transfer using the analog telephone network
- It can also be used as a dedicated line modem. Duplex data transfer is thus possible in the voice band over 2-wire dedicated lines.
- Private or leased telephone lines can be used as dedicated lines.

Benefits

g e**t** **get** Designed for Industry

- RS232 and RS485 interface
- Isolation between voltage supply and RS232/RS485 interface
- Transmission rate on the telephone network and dedicated line max. 33600 bit/s

Application

The MD3 modem can be used as a telephone modem or dedicated-line modem independently of the SINAUT ST7 system. Due to its design and electrical properties, the MD3 is especially suited for use in the industrial sector.

Telephone modem

When used as a telephone modem, it enables connections to be set up with other MD3 or compatible modems, e.g. with the MD125 and MDM2425B DX modems that were used with the SINAUT ST1 system.

Dedicated-line modem

Apart from private dedicated lines, the MD3 can also be connected to Telekom leased lines. Corresponding approval exists. There are no restrictions in terms of the possible transmission rates either with exclusively analog leased lines or with analog/digital converted leased lines.

When used as a dedicated-line modem on private lines, the MD3 enables distances of up to 34 km (at 300 bit/s), 28 km (at 1200 to 19200 bit/s) and up to 19 km (at 33600 bit/s) to be spanned without amplifiers/repeaters (guide values for uncoiled communication cable of type 2 x 2 x 0.8 J-Y(St)Y).

When connected to Telekom leased lines, any distance can be spanned. Depending on the quality of the leased line in each case, the leased line provider guarantees sufficient reception signal level at both end points. The line qualities M1020 and M1025 are recommended.

Used as a dedicated-line modem, the MD3 enables networks to be constructed in "point-to-point" or "star" configurations. If the modem is used in the central office, the star network can be expanded to as many as 32 point-to-point connections by linking several MD3 modems via their RS485 interface.

Design

The MD3 modem offers all the advantages of the SIMATIC S7-300 design:

- Compact construction; double standard width of SIMATIC S7-300 SM modules
- RJ12 socket for connecting the modem via the supplied 6NH7700-3BR60 connecting cable to the telephone jack or the dedicated line
- 9-pin Sub-D connector with an RS232 interface for connecting the modem to the RS232/RS485 interface of the TIM
- 9-pin Sub-D connector with an RS485 interface for connecting the modem to the RS232/RS485 interface of the TIM
- 4-pin plug-in terminal strip for connection of the 24 V DC external supply voltage
- Front-panel LEDs indicating TXD, RXD, DTR, RTS/ONL, CTS/RI and DCD
- Easy installation; the modem is mounted on an S7-300 mounting rail; alternatively, it can be mounted on a 35mm standard rail using the adapter 6NH7760-0AA, available separately.
- The modem can be operated without a fan.

■ Integration

The diagrams below illustrate how the MD3 modem and the TIM module can be connected to the telephone outlet and which configurations are possible when the modem is used as a dedicated-line modem.

Telephone modem: Connection of the MD3 with a TIM and TAE6 telephone outlet

The diagram below illustrates how the MD3 modem, when operating in dial-up mode and using the standard connecting cable specified (the 6NH7700-3BR60 connecting cable is part of the scope of supply of the MD3), is connected to a TIM (via RS232) as well as to the telephone outlet (TAE6N socket). A telephone can be connected to the same telephone outlet in parallel with the modem (via the TAE6F socket).

Connection of a MD3 with a TIM and TAE6 telephone outlet

Dedicated-line modem: Connection of an MD3 to a TIM via the RS232 interface

One MD3 modem can be connected to a TIM via the RS232 interface. This technique can be used to set up a "point-to-point" network configuration.

Dedicated-line modem: Connection of several MD3 to a TIM via the RS485 interface

Several MD3 modems can be connected to a TIM via the RS485 interface. This type of interconnection is used if several dedicated lines have to be combined on a single WAN port on the TIM, i.e. if a point-to-point network is connected.

Dedicated-line modem: Maximum range (in km) of the MD3 modem

The table below can be used to calculate approximate values for the maximum distance in km which can be covered by the MD3 modem, depending on transfer rate.
The values in the table are guide values for non-coil-loaded message lines type 2 x 2 x 0.8 J-Y(St)Y.

A level reserve of 4 dB was applied when calculating the maximum ranges. This should ensure that even in the event of deviations in cable characteristics, which experience has shown to be possible during operation, the level will always be sufficient to ensure fault-free data transmission.

Transfer rate (bit/s)	Maximum range (km)			
	Transmission level –15 dB		Transmission level -10 dB	
	With LTOP	Without LTOP	With LTOP	Without LTOP
With terminating resistor Z = Zr				
300	29	30	34	35
1200 to 19,200	23	24	28	29
33600	14	15	19	20

Telecontrol network – Modems

MD3 telephone modem

■ **Technical specifications**

MD3 telephone modem	
Interfaces	
• Connection for telephone network or dedicated line	1 x RJ12
• RS232 connection for data terminal equipment	1 x 9-pin Sub-D connector
• RS485 connection for data terminal equipment	1 x 9-pin Sub-D socket
• Connection for supply voltage	1 x 4-pin terminal block
Voltage supply	24 V DC
Current consumption	
• from 24 V DC	200 mA
Power loss	4.8 W
Permissible ambient conditions	
• Operating temperature	0 °C … +60 °C
• Transport/storage temperature	-40 °C … +70 °C
• Relative humidity	max. 95 % at +25 °C
Design	
• Module format	Compact module S7-300, double width
• Dimensions (W x H x D) in mm	80 x 125 x 120
• Weight	approx. 300 g
Degree of protection	IP20
Transmission path	Analog dial-up telephone network
	Dedicated line, 2-wire twisted pair cable, non-coil-loaded
Available ITU transmission standards in analog telephone network	
• V.22	1200 bit/s, duplex
• V.22 up to	2400 bit/s, duplex
• V.32 up to	4800 bit/s, duplex
• V.32 up to	9600 bit/s, duplex
• V.32 up to	14400 bit/s, duplex
• V.34 up to	19200 bit/s, duplex
• V.34 up to	33600 bit/s, duplex
Error correction	V.42 and MNP4
Data compression	V.42bis and MNP5
Modem control	AT commands V.25bis commands

MD3 telephone modem	
Telephone charge pulse filter can be set to:	12 kHz 16 kHz
Dial-up procedure	Voice frequency dialing Pulse dialing
Loop current component	Available; can be connected and disconnected
Loudspeaker	Available; can be connected and disconnected
Line matching	600 ohms Zr (frequency-dependent)
Transmission level can be set to	-10 dB -15 dB
Asynchronous character format	10 or 11 bits
Standard dedicated-line profiles	300 bit/s (direct)
	1200 bit/s (direct)
	2400 bit/s (direct)
	9600 bit/s (direct)
	19200 bit/s (direct)
	19200 bit/s (buffered)
	33600 bit/s (buffered)
Compatible with SINAUT modems (as telephone modem)	
• MD125	
- V.22	1200 bit/s, duplex
- V.22 up to	2400 bit/s, duplex
• MDM2425B DX	
- V.22 up to	2400 bit/s, duplex
• MD3 (HW version < 4)	
- V.22	1200 bit/s, duplex
- V.22 up to	2400 bit/s, duplex
- V.32 up to	4800 bit/s, duplex
- V.32 up to	9600 bit/s, duplex
- V.32 up to	14400 bit/s, duplex
Approvals	Europe U.S.A. Canada
Recommended line quality on leased telephone lines	M1020 M1025

EGPRS Router MD741-1

Overview

- EGPRS (GPRS with Edge) and GPRS router for wireless IP communication from Ethernet-based automation devices over GSM mobile radio networks
- Four times the transmission speed by means of EGPRS
- Integrated security functions with firewall and VPN (IPsec)

Benefits

get   Designed for Industry

- Monitoring and controlling wirelessly connected telecontrol substations with low investment and operating costs
- Reduction in traveling costs and telephone charges due to remote programming and diagnostics by means of GPRS
- User-friendly diagnostics by means of terminal clients and short download times due to the higher speed with EGPRS
- High security thanks to IPSec-based VPN functionality and firewall
- Savings in configuring time thanks to the SCALANCE S Security Module through tailored VPN configuration
- Controlling and monitoring over the GPRS infrastructure of the mobile telephone providers with low-cost M2M standard contracts because VPN is integrated
- Easy planning and commissioning of substations without special wireless expertise
- Can be used worldwide thanks to to quad-band technology (observe national regulations!)

Application

- The MD741-1 EGPRS router is universal. Due to its design and electrical characteristics, the EGPRS router is particularly suitable for use in industrial applications.
- Remote programming and maintenance worldwide by means of the high-speed EGPRS interface
- Energy-saving concepts for plants, e.g. through status-dependent speed control of pumps in remote stations
- Control and monitoring of
  - Sewage treatment plants, water treatment
  - Oil and gas supplies
  - District heating networks
  - Power distribution
  - Pumping stations
  - Traffic systems
  - Buildings
  - Wind generators and photovoltaic plants
- Linking of mobile stations, with central monitoring and control
- Remote diagnostics of SIMATIC S7 via GPRS with STEP 7

Design

- Rugged plastic housing for standard rail mounting
- RJ45 interface for Industrial Ethernet
- Diagnostic LEDs for modem status, field strength and connection control
- SET service button
- 4-pin screw terminal for connection to the 24 V DC power supply
- SMA antenna connection for GSM/EGPRS antenna

Function

- Quad band GSM with the frequency bands 850/900/1800/1900 MHz
- High-speed communication via EGPRS Multislot Class 12 in EGPRS networks;
  if there is no EGPRS network, automatic switchover to GPRS mode
- Automatic setup and holding of IP-based online connection to the Internet
- Bidirectional IP-based data communication with the telecontrol center, e.g. ST7cc or ST7sc;
  data is exchanged between telecontrol stations (inter-node communication) over a TIM communication module in the control center
- Integrated security functions with firewall and VPN (IPsec)
- Secure data communication with the SINAUT ST7 stations, also over mobile radio provider networks which do not provide public and fixed IP addresses for the modem

9

Function (continued)

Configuration

- Parameterization of the router using HTML Web browsers

Security

- VPN router for secure data transmission over public networks (IPSec protocol, 3DES data encryption, AES encryption, NAT-Traversal)
- Suitable VPN termination of the control center via SCALANCE S612 or S623 [1]
- Firewall for protection from unauthorized access The dynamic packet filter checks data packets based on the source and target address (stateful packet inspection) and blocks undesirable data traffic (anti-spoofing)

Diagnostics / maintenance

- Connection buildup status and status of an existing connection via front LED display

Preconditions for implementing the EGPRS router MD741-1

- SIM card from a network operator that supports EGPRS

Integration

VPN termination over SCALANCE S

If a central router expected by IT personnel is not found in the control center, it is recommended that the VPN channel of the EGPRS router MD741-1 is terminated using a SCALANCE S module (SCALANCE S612 or S623 [1]) with firmware V 2.0 or higher). The SCALANCE S configuring tool can be used to configure the VPN to suit the MD741-1. This saves the work involved in configuring the settings of a generally available router.

Telecontrol application example

The diagram below shows an S7-300 station with TIM 3V-IE and MD741-1 connected to the control center (e.g. SINAUT ST7cc or ST7sc) via EGPRS and Internet. The VPN channel of the MD741-1 is terminated in the control center by means of a SCALANCE S module (S612/623 [1]). Behind the SCALANCE S module, a TIM 4R-IE is installed. For the control center, this module performs the SINAUT communication with the stations connected via the Internet as well as with the stations that are connected to the TIM 4R-IE via two other networks. Cross traffic between individual stations in the various networks is routed via the TIM 4R-IE.

As an option, the control center software can be augmented with the alarm control center (ACC) software package. This enables fault messages from the plant to be forwarded to service personnel by SMS, fax or e-mail.

[1] Available soon

Secure telecontrol with SINAUT ST7 over IP-based networks

Integration (continued)

Application example for teleservice

Remote programming, parameterization and diagnosis can be performed securely via VPN from a service center that is connected over the Internet to machines and plant installed world-wide. All the automation devices connected to the Ethernet port of the MD741-1 can be accessed.

Typical remote access scenarios to distributed SIMATIC S7 stations via a secure EGPRS-based Internet connection

Industrial Remote Communication
Telecontrol network – GSM/GPRS/UMTS routers

UMTS-Router SCALANCE M87x

Overview

- UMTS, EGPRS (Edge GPRS) and GPRS router for wireless IP communication of Industrial Ethernet-based PLCs over UMTS/GSM mobile wireless networks
- High data transfer rate thanks to UMTS
- Integrated security functions with firewall
- *SCALANCE M875* [1]
  Use both as VPN server and as client (IPsec)

Benefits

get Designed for Industry

- Low investment and operating costs for operator control and monitoring of wirelessly connected telecontrol substations
- Reduced travel costs and telephone charges thanks to remote programming and remote diagnosis via UMTS
- High security thanks to integral firewall and VPN with IPsec (SCALANCE M875 only)
- Utilization of existing UMTS/GSM infrastructure of the mobile radio providers
- Simple planning and commissioning of telecontrol substations without special radio expertise

Application

- Can be used in industrial and semi-industrial applications due to its design and electrical properties
- Remote programming and maintenance worldwide, e.g. with STEP 7 via the high-speed UMTS interface
- Linking of mobile stations, with central monitoring and control
- Energy-saving concepts in distributed systems, e.g. through status-dependent speed control of pumps in remote stations
- Control and monitoring of
  - Sewage treatment plants, water treatment
  - Oil and gas supplies
  - District heating networks
  - Power distribution
  - Pumping stations
  - Transportation systems
  - Buildings
  - Wind energy and photovoltaic plants
- Connection of telecontrol substations (e.g. SINAUT ST7) to control center via UMTS
- Video transmission e.g. from moving vehicles such as buses and trains
- Can be used worldwide due to:
  - UMTS: tri-band technology
  - GSM: quad-band technology

Note:
Country-specific approvals must be observed.

Due to the integral security functions, the SCALANCE M875 UMTS router enables protected connection of distributed automation cells to a control center via the mobile wireless network, and it can be used within the scope of the Siemens Remote Service. This comprehensive service allows companies to task Siemens with the monitoring, control and maintenance of distant plants and machines via remote access.

Design

- Rugged plastic enclosure for standard rail mounting
- RJ45 interface for Industrial Ethernet
- Diagnostic LEDs for modem status, field strength, connection control, and DI/DO channels
- SET service button
- 4-pin screw terminal for connection to the 24 V DC power supply
- 4-pin screw terminal for one digital input and one digital output
- SMA antenna connection for UMTS/GSM antenna

Product versions

SCALANCE M873

- 1 x RJ45 port with 10/100 Mbit/s
- 1 x SMA antenna connection
- Support for UMTS with HSDPA (downlink: 3.6 Mbit/s, uplink: 384 kbit/s)
- Integral firewall function

SCALANCE M875 [1]

- 2 x RJ45 ports with 10/100 Mbit/s
- 2 x SMA antenna connection (antenna diversity)
- Support for UMTS with HSDPA and HSUPA (downlink: 14.4 Mbit/s, uplink: 5.76 Mbit/s)
- Integral firewall function and VPN with IPsec
- Type approval as vehicle component in accordance with Directive 72/245/EEC in Version 2009/19/EC

[1] Available soon

Industrial Remote Communication
Telecontrol network – GSM/GPRS/UMTS routers

■ Function

- Tri-band UMTS with the frequency bands 850/1900/2100 MHz
- Quad band GSM with the frequency bands 850/900/1800/1900 MHz
- Without UMTS network, automatic switchover to EGPRS (Multislot Class 12) or GPRS mode
- Automatic setup and holding of IP-based online connection to the Internet
- Merging of distributed, IP-based networks via UMTS/GSM mobile radio networks
- Bi-directional IP-based data communication with the telecontrol center, e.g. ST7cc or ST7sc, WinCC or PCS7
- Integrated security functions with firewall
- Data exchange between telecontrol stations (slave-slave communication) via a TIM communication module in the service center
- Secure data communication with the SINAUT ST7 stations, also over mobile radio provider networks which do not provide public and fixed IP addresses for the modem
- Automatic and user-defined sending of text messages

Configuration

- User-friendly configuration of all network and firewall parameters of the router using the web browser

Security

- Router for data transmission via public networks with NAT functionality (NAT-Traversal)
- Suitable VPN termination of the control center via SCALANCE S
- Firewall for protection against unauthorized access; the dynamic packet filter checks data packets based on the source and target address (stateful packet inspection) and blocks undesirable data traffic (anti-spoofing)

Diagnostics / maintenance

- Status of connection buildup and of an existing connection via front LED display and web browser

Preconditions for using the SCALANCE M873 UMTS router

- SIM card from a UMTS network operator with HSDPA support, or alternatively a SIM card from a GSM network operator with EGPRS or GPRS support

■ Integration

Application example SCALANCE M873 Internet access without VPN or with VPN provider

A distributed S7-300 station is connected to the Internet with the help of the SCALANCE M873 UMTS router. This makes it possible to access the plant over the Internet via HTTP or HTTPS, and to monitor remote plant sections. It is also possible to inform service engineers, for example, of statuses by sending e-mails. The mobile radio provider's secure tunnels can be used for transmitting confidential information with the SCALANCE M873. The provider's APN (**A**ccess **P**oint **N**ame), to which the encrypted connection is established, is located at the network transition to the mobile wireless network. Availability varies depending on the network operator.

Typical remote access scenarios via an UMTS-based Internet connection

9

Industrial Remote Communication
Telecontrol network – GSM/GPRS/UMTS routers

Integration (continued)

Application example: SCALANCE M875 [1] for remote maintenance with VPN tunnel

Classical applications such as remote programming, parameterization and diagnosis, but also monitoring of machines and plants installed worldwide can be performed securely via a VPN from a service center that is connected over the Internet. Any

IP-based devices, especially IP-based programmable controllers, which are downstream of the SCALANCE M875 in the local network, can be accessed.

Multimedia applications like video streaming can be implemented thanks to the increased bandwidth in the uplink.

Typical remote access scenario via a secure UMTS-based Internet connection

[1] Available soon

■ Integration (continued)

Application example, broadband data transmission in vehicles with SCALANCE M875 [1]

The UMTS router SCALANCE M875, with its high down-link and uplink capacity, supports numerous data services with large bandwidth requirements via mobile wireless to and from vehicles. To increase the connection quality during motion, SCALANCE M875 is equipped with antenna diversity. Alternatively, sensitive data can be transmitted in a secure VPN tunnel.

Video transmission in real-time from the passenger cell is used to increase passenger safety (video surveillance). The video data from all vehicles is sent to a control central for monitoring and further processing.

In addition, applications such as data interfacing for ticket machines, infotainment services and Internet on board, or proactive monitoring of vehicle engineering (telemetry) are also possible.

Broadband video data transmission over UMTS, protected via VPN, to increase passenger safety

[1] Available soon

Industrial Remote Communication
Telecontrol network – GSM/GPRS/UMTS routers

UMTS-Router SCALANCE M87x

Integration (continued)

Application example for SINAUT ST7 with SCALANCE M875 [1]

The diagram below shows an S7-300 station with TIM 3V-IE and SCALANCE M875 connected to the control center (SINAUT ST7cc or ST7sc) via UMTS and the Internet. Behind the SCALANCE S module, a TIM 4R-IE is installed. For the control center, this module performs the SINAUT communication with the stations connected via the Internet as well as with the sta-

tions that are connected to the TIM 4R-IE via two other networks. Cross traffic between individual stations in the various networks is routed via the TIM 4R-IE.

As an option, the control center software can be augmented with the alarm control center (ACC) software package. This enables fault messages from the plant to be forwarded to service personnel by SMS, fax or e-mail.

Secure telecontrol with SINAUT ST7 over IP-based networks

[1] Available soon

■ Integration (continued)

Application example: SINAUT ST7 with SCALANCE M873

In the application given here, three S7-300 stations with a TIM module are connected to a control center (SINAUT ST7cc, ST7sc or STEP 7 with ST7 ES) via the Internet or the mobile wireless network. A TIM 4R-IE is installed in the control center. This module handles the SINAUT communication with the connected stations on behalf of the control center. To make the connection to the remote stations secure, the TIM 4R-IE establishes a VPN tunnel to the remote stations.

One station is connected with the help of a DSL router. The two other stations are connected to the control center either using an M873 UMTS router or an MD720 GSM modem over the mobile wireless network. Since the MD720 GSM modem establishes the VPN tunnel in the direction of the control center, a TIM 3V-IE module is used here. The two other stations are equipped with a TIM 3v-IE Advanced since the VPN tunnel must be established via the TIM module.

Secure telecontrol with SINAUT ST7 over secure VPN connections by means of TIM modules

Industrial Remote Communication
Telecontrol – Accessories

LTOP overvoltage protection

Overview

- Line transformer with overvoltage protection
- For electrical isolation of a dedicated line modem from the trunk line
- For protection against overvoltages that can be injected into a trunk line

Benefits

g e t **get**   Designed for Industry

- Reduces overvoltage to tolerable levels before they reach sensitive electronics circuits
- Electrically isolates line sections; prevents interference due to external voltages
- Limits damage to segments affected by overvoltage
- The protective components are housed in a plug-in OPM overvoltage module. The OPM can be replaced without interrupting the trunk line.

Application

Dedicated copper lines are susceptible to electromagnetic interference. The coupling of extraneous voltages can be inductive or capacitive, for example due to the effects of lightning. Direct conductive coupling is also possible due to bad insulation.

The LTOP overvoltage protection limits external voltage and overvoltage to a non-critical level. The floating transformer additionally provides electrical isolation, and the transfer of voltages to other cable sections are therefore prevented.

LTOP protects people and investments, and is therefore an essential safety element in private trunk line networks.

Note:

The LTOP modules are not suitable for protecting dial-up connections (telephone or ISDN network). Companies such as Phoenix and Dehn offer TAE6, S_0, RJ-12, and RJ-45 jacks with overvoltage protection.

Design

The protection concept consists of a combination of components that complement each other in terms of functionality:

- Surge arresters filled with noble gas as coarse protection (G1, G2)
- Inductance that limits the rise of the current (L1, L2)
- Metal-oxide varistor as surge protection (voltage-dependent resistor; R1)
- Translator for galvanic decoupling (T1)
- Suppressor diode for limiting the secondary voltage of the translator (V1)

The overvoltage protection module LTOP is available in two versions:

- **LTOP 1;**
  overvoltage protection module for use at the beginning or at the end of a 2-wire cable

- **LTOP 2;**
  overvoltage protection module for use at the beginning or at the end of a 4-wire cable or at a 2-wire grading point. At a 4-wire graded point, two LTOP2 units are needed.

Both LTOP versions feature screw-type terminals and an RJ12 Western jack. The WAN connecting cable (RJ12 - RJ12) that came with the MD2 and MD3 modems (used as dedicated line modem) can be connected directly to this RJ12 jack.

9

■ Function

The combination of arresters and limiters supplemented by the line transformer is more effective than galvanically-coupled protection concepts.

Leakage voltages place considerable strain on protective components in the OPM, slowly destroying them beyond repair. We therefore recommend that OPMs are replaced approximately once a year. In areas affected by frequent thunderstorms, this should be reduced to approximately every 6 months as a precautionary measure.

■ Integration

If necessary, several LTOP enclosures can be interconnected.

9

■ Overview

- Quadruple transformer for the multiplication of the trunk line connection of a dedicated line modem from 1 x 2-wire to 4 x 2-wire

■ Application

In a controller, the quadruple transformer enables up to four point-to-point or line connections (each 2-wire) to be made in a start-type configuration, or a combination of both network topologies.

The transformer is only designed for a frequency range between 300 and 3400 Hz. In conjunction with the MD2 modem, transmission rates are limited to 1200 and 2400 bit/s.

■ Design

The quadruple transformer is housed in a sheet-steel enclosure. It is mounted on a 35 mm standard mounting rail.

The trunk line is connected by means of soldering tabs.

■ Integration

If several dedicated lines have to be combined on one WAN port of the TIM, i.e. if coupling a point-to-point network is involved, this can be achieved by connecting several MD2 modems in parallel. 2 x 2-wire terminals can be connected per MD2. With the aid of the fourfold translator, the number of 2-wire terminals per MD2 can be increased from 2 to 4. This means an additional attenuation of 6.5 dB for a transmission rate of 1200 bit/s, which results in a reduction of the max. range by approx. 6 km.

The following figure shows a possible configuration of the interconnection in the star point for max. 4 x 2-wire terminals with the aid of the fourfold transformer and other standard components (the plug-in cable 6NH7700-2AR60 is part of the scope of delivery of the MD2 modem).

Note:
For configuring the terminals and tapping points in the stations, see dedicated line modem MD2.

Industrial Remote Communication
Telecontrol – Accessories

ANT794-3M GSM/GPRS antenna

■ Overview

- Flat panel antenna for mobile telephony for GSM 900/1800/1900
- Suitable for exterior and interior installation
- Electrically independent installation
- Ready for connection with cable for GSM/GPRS modems with SMA connection

■ Benefits

get Designed for Industry

- Durable mounting in plastic switching boxes
- Installation without specialist knowledge of high frequency
- Universal in use, also on grounded or non-grounded metal surfaces without adversely affecting the radiation properties

■ Application

- For use in GSM/GPRS networks
- Indoors and outdoors (IP64 degree of protection)
- Operating temperature –40 °C to +70 °C
- For installation in plastic control boxes

■ Design

- Emitters accommodated in protective plastic housing
- Installation using screws or adhesive pad

ANT794-4MR GSM/GPRS antenna

Overview

- Omnidirectional antenna for use in GSM/GPRS/UMTS networks
- Remote antenna for indoors/outdoors
- Suitable for quad band
- Complete with cable and mounting bracket for direct connection to SINAUT GPRS modems

Benefits

get **get** Designed for Industry

- Weatherproof design allows installation outside buildings to improve the field strength
- Quad band technology permits international use

Application

- For use in GSM/GPRS/UMTS networks
- For indoors/outdoors (IP65 degree of protection)
- Operating temperature -40 °C to 70°C

Design

- Radiator accommodated in a plastic tube for protection
- RF cable with fixed connection to antenna
- Fixed and rugged vertical installation outside control cabinet

PPI modem cable

Overview

- Intelligent RS232/PPI multimaster cable for connecting modems with RS 232 interface to SIMATIC S7-200 (RS485)

Benefits

get   Designed for Industry

- Matching cable length for control cabinet assembly
- No RS232 adapter (gender changer) required for modem connection
- Simple fixing of cable in control cabinet using Velcro fastener

Application

The intelligent RS 232/PPI multimaster cable can be used for the connection between modems and the S7-200. It is then possible to connect modems such as the GSM modem MD720-3 with RS232 interface to the PPI interface of the S7-200 without using a gender changer. As a result of the short cable lengths and the industrial Velcro fasteners, the PPI modem cable is suitable for use in control cabinets.

Design

- 24 V DC power supply via the RS485 interface of the SIMATIC S7-200
- Three LEDs for status display:
  - Tx, green: RS232 send
  - Rx, green: RS232 receive
  - PPI, green: RS485 send

Function

PPI mode:
- Signal conversion from RS232 to RS485
- Control of token in a multimaster PPI network (PPI master)
- Supports 10-bit modem protocol via RS232, and DPT and PPI protocols via RS485

Freeport mode:
- Signal conversion from RS232 to RS485
- Switchover between local and remote modes
- Configuration in local mode using DIP switches
- Configuration in remote mode using terminal program (e.g. MS Hyper Terminal)
- Supports AT modem commands and PIN for Siemens modems

For connecting modems with RS232 interface to SIMATIC S7-200	

9

Overview

There is a series of standard connecting cables for connecting the SINAUT components to one another or to the respective WAN. Some of these cables are already supplied as a permanent item along with the hardware components and are listed in the ordering data of these components as spare parts.

Ordering data

	Order No.
Connecting cable	
For connecting a TIM with a SINAUT ST7 MD2, MD3 or MD4 modem; cable length 1.5 m	
• RS 232 Also suitable for interfacing the modems listed with a SIMATIC point-to-point CP such as the CP340, CP341 or CP441 with RS232 interface	**6NH7 701-4AL**
• RS485	**6NH7 701-4DL**
Connecting cable	**6NH7 701-1CB**
For connecting two MD2 modems (RS 232) in order to create a repeater; cable length 0.3 m	
Connecting cable	**6NH7 701-5AN**
For connecting a TIM (RS232) with the GSM modem MD720-3; also suitable for third-party modems or radio equipment with standard RS232 interface; cable length 2.5 m	
Connecting cable open at one end	**6NH7 701-4BN**
For connecting a TIM (RS232) with a third-party modem or radio unit (RS232); cable length 2.5 m	
Test cable	**6NH7 701-0AR**
Connecting cable for connecting two TIMs via their RS232 interface without modems ("null modem"); cable length 6 m

Industrial Remote Communication
Telecontrol – Accessories

DCF77 antennas

■ Overview

Every TIM module with an integrated DCF77 radio clock is supplied with an adapter cable which terminates in a BNC connector. Various accessories both for the DCF77 and for GPS can be connected to this.

- **DCF77 indoor antenna**
  An indoor antenna can be used in buildings in which there are no sources of interference for the DCF77 signal. It should not be installed in the vicinity of televisions, monitors, thyristor controls, network cables or fluorescent lights.

- **DCF77 outdoor antenna for mounting on a flat roof, wall, or mast**
  A professional radio clock system should be operated with an external antenna wherever possible. In contrast to an indoor antenna whose environment can change constantly due to the technical activity in the building, the conditions for an outdoor antenna are practically constant. Indirect lightning protection is strongly recommended for an outdoor antenna.

If the 6NH9831-2AA lightning protector is used, this should be installed as close to the entrance of the building as possible.

9

■ Overview

The reception of the DCF77 radio clock signal is limited to western Europe (approximately 800 km radius from Frankfurt am Main, Germany). In regions where this signal cannot be received, use of a GPS receiver is recommended to acquire the local time from a satellite-based GPS system (Global Positioning System).

For this situation, the SINAUT system includes a GPS receiver whose output signal simulates the DCF77 signal. This receiver can therefore be connected directly to the DCF77 receiver in the TIM and can supply the TIM with the current time.

This GPS receiver ships as a complete package and includes the following:

- GPS receiver module that can be snapped onto a 35-mm standard rail
- GPS outdoor antenna for wall or mast mounting, including 25 m antenna cable
- BNC adapter to connect the DCF77 adapter cable of the TIM to the BNC socket of the GPS receiver
- Software for configuring the GPS receiver (for Windows 3 x, 95, NT)
- PC adapter cable, length 1.5 m
- Documentation

Since the GPS antenna is an outdoor antenna, you should also install the lightning protection device provided for this purpose.

If 6NH9 831-8LA lightning protection is used, this should be installed whenever possible at the entrance to the building.

■ **Overview**

Teleservice (remote diagnostics and remote maintenance)

Teleservice involves data exchange with distant technical systems (machines, plants, computers, etc.) for the purpose of fault detection, diagnostics, maintenance, repair or optimization.

Machines and plants are increasingly operated in places which are far away from the supplier's premises. Despite this, plant builders must offer services to deal with faults or for preventive maintenance. Especially during the warranty period this can result in high costs. Teleservice helps to significantly reduce this risk.

There are a variety of possible applications for Teleservice. Plants can be diagnosed, values set and data transmitted from any place on earth via a telephone cable. Teleservice also enables the SIMATIC controllers to send text messages per SMS or e-mail, making a significant contribution to saving travel and personnel costs in service work.

Teleservice via IP-based networks

Optimum remote maintenance is based on reliable, permanently available, secured and economical data connections.

Depending on the application, SIMATIC NET provides the appropriate solution:

- For continuous connections or simultaneous access to several plants, a solution using the SCALANCE S and SCALANCE M security and communication components is recommended, both on the service and the plant side.
- For flexible access for remote maintenance from any Internet connection - whether in the office, home office or hotel room – SOFTNET Security Client is the right software solution for establishing a secure connection to the plants.
- For plants without wired network connection, the MD741-1 (EGPRS) and SCALANCE M (UMTS) mobile wireless routers establish remote maintenance access to the SCALANCE S in the service center.

In all cases, the communication is reliably protected by authentication and encryption via a VPN tunnel (**V**irtual **P**rivate **N**etwork) in order to rule out the possibility of attacks from outside.

Siemens Remote Services

The service concept of "Siemens Remote Services" provides a powerful, secure platform for remote access to machines and plants. The inclusion of "Shared Experts" ensures effective support, not only from Siemens but also from the internal company specialists.

9

Industrial Remote Communication
Teleservice

SIMATIC TeleService

Overview

Teleservice with TS Adapter IE

Teleservice with TS Adapter II

Teleservice with TS Adapter IE Basic

- For performing remote maintenance over the telephone network:
  A PG/PC with an Engineering Tool installed, e.g. STEP 7, can access automation components (e.g. S7 CPUs) over the telephone network that are connected to the appropriate adapters over Industrial Ethernet or PROFIBUS.
- Comprising the TeleService software and different adapters:
  - TS Adapter II for connection to PPI, MPI or PROFIBUS DP
  - TS Adapter IE or TS Adapter IE Basic for connection to Industrial Ethernet
- Additional functions with TS Adapter II:
  - Establishing a connection from/to remote plants, e.g. for calling up process data from an automation system (*PG-to-AS remote coupling*).
  - Exchanging data between plants (*AS-to-AS remote coupling*):
    Exchange of process data between two SIMATIC automation systems.
  - Sending a *text message*:
    Sending a text message from a SIMATIC automation system via a GSM wireless modem.
- Additional functions with TS Adapter IE:
  - Remote operation of HMI devices:
    Access to the HMI device via an Internet browser installed on the adapter
  - Sending e-mails:
    Establishing a modem link to a dial-up server (e.g. to an Internet service provider): A SIMATIC CPU can send e-mails over an e-mail server that can be accessed in this manner.
  - Standard routing:
    A modem link can be established to an Internet service provider for accessing data on the Internet.

Application

With TeleService, remote servicing of SIMATIC S7 automation systems or HMI devices is possible using the programming device or PC over a fixed line or wireless network. With the help of TeleService, the connection to the automation components is extended over the telephone network to the programming device or PC. The functions to be performed, such as programming, are completed using the same tools and functionality as if the job was being done locally. The user has access to the familiar functions of STEP 7 and the Engineering Tools, comparable to a local MPI connection.

TeleService increases the effective availability of plants and machines. Access through TeleService means that technical services (e.g. maintenance, updating, and troubleshooting) can be performed cost-effectively from a central service center.

Apart from teleservice, a remote link to a programming device or PC can be established program-controlled using a function block call. This link allows process data to be exchanged between an S7 CPU and the programming device or PC with support from PRODAVE.

■ **Design**

Different components are required in accordance with the TeleService function.

For remote maintenance:

- TeleService engineering software (not required when using the TIA Portal).
- A modem at the programming device/PC end
- A TS adapter (TS Adapter II or TS Adapter IE), line-side.

Required in addition to the components for remote maintenance in the case of PG/PLC remote coupling:

- PRODAVE V5.0 and higher for PG/PC:
  Toolbox for process data traffic between SIMATIC S7/C7 and the PC for autonomous processing of data traffic.
- "PG_DIAL" function block (included in TeleService software package) for the PLC.
- A TS Adapter II, line-side.

Required in addition to the components for remote maintenance in the case of PLC/PLC remote coupling:

- TS Adapter for the second PLC.
- "AS_DIAL" function block (included in TeleService software package) for the PLCs.
- A TS Adapter II, line-side.

For sending text messages:

- Engineering Software TeleService Version 5.2 and higher.
- GSM wireless modem on line side, Hayes-compatible.
- TS Adapter II, line-side.
- Modem cable for connecting the TS Adapter and modem (included in TS Adapter II package).

For sending e-mails:

- Engineering Software TeleService Version 6.1 and higher
- TS Adapter IE, line-side.
- Internet service provider and an e-mail server that can be accessed there.

For remote control of HMI devices:

- PG/PC with browser - e.g. Internet Explorer - and the Sm@rtViewer
- TS Adapter IE, line-side.
- SIMATIC HMI device with an installed Runtime option of WinCC flexible /Sm@rtService or /Sm@rtAccess.
  For further information on WinCC flexible and the Sm@rt options, see www.siemens.com/simatic-wincc-flexible.

TS Adapter II

Main features of TS Adapter II:

- Single-width standard S7-300 housing.
- Mounted onto DIN or S7-profile rail, therefore no time-consuming cabinet installation required using a mounting plate.
- Integral modem, either analog or ISDN as required.
- USB interface for parameterization. This interface can also be used locally as a programming interface for the connected devices.
- Serial RS232 interface for connecting external modems (e.g. wireless modem).
- Firmware with update capability.
- Power supply over MPI or over external 24 V power supply.
- Connection of an external modem, e.g. a GSM wireless modem, over serial interface.
- Can be connected to:
  - MPI
  - PROFIBUS DP up to 12 Mbit/s (previously 1.5 Mbit/s)
  - PPI

Scope of delivery:

The following components are supplied with the TS Adapter II:

- DVD with driver
- TeleService software V6.1 (Can be used for 14 days. For further operation, a license is required)
- MPI cable, 0.8 m, for connecting the adapter to the MPI/DP interface.
- Standard telephone cable, 3 m, with RJ12 connectors (only for TS Adapter II modem).
- Standard telephone cable, 3 m, with RJ45 connectors (only for ISDN TS Adapter II).
- TAE6N plug (only for TS Adapter II modem).

When using the TS Adapter II modem outside Germany, a standard national telephone plug can be snapped onto the RJ12 connector. A TAE6N connector is supplied for Germany. In some countries, telephone sockets with RJ12 sockets are available, in which case telephone cables can be used without the need for a telephone plug.

For operation, TeleService Software Version 6.0 is required.

9

■ **Design** (continued)

TS Adapter IE

Main features of TS Adapter IE:

- Single-width standard S7-300 housing.
- Mounting on DIN or S7 rail.
- Integral modem, either analog or ISDN as required.
- Firmware with update capability.
- Power supply over external 24 V power supply.
- Serial interface for connection of an external modem, e.g. a GSM wireless modem.
- An RJ45 Ethernet interface (10/100 Mbit/s).
- Industry-compatible in accordance with SIMATIC standard.

Parameterization:

The TS Adapter IE can be parameterized locally or over a remote link. TeleService software V6.1 or an Internet browser is used for this purpose.

The firewall is parameterized easily by selecting and deselecting the appropriate services with a click of the mouse button. In "expert mode", the adapter can also be parameterized like a standard router.

Security:

Only dial-in access is possible: The service engineer dials into the adapter using a supplied telephone number. Authentication is performed by means of a user log-in with a password and Challenge Handshake Authentication Protocol (CHAP). Up to 8 user accounts can be created with different log-ins and passwords.

As an option, e.g. for security reasons or to save telephone charges, the TS Adapter IE will interrupt the connection following correct authentication and call the user back on the telephone number stored in the TS Adapter IE.

The implemented firewall protects the plant from unauthorized access over the Internet. By default, the firewall only permits S7 communication. The required services, e.g. Sm@rt-Access, Sm@rt-Service or PCAnywhere, can be individually enabled during parameterization. For sending e-mails, it is necessary to enable the SMTP protocol and to set the parameters for outgoing calls. It is also possible to block all incoming data packets during connection to the Internet.

Scope of delivery:

The following components are supplied with the TS Adapter IE:

- CD with drivers and TeleService V 6.1 software (can be used for 2 weeks without a license) including standard software for sending e-mails from S7 CPUs.
- Standard telephone cable, 3 m, with RJ12 connectors (only for TS Adapter IE modem).
- Standard telephone cable, 3 m, with RJ45 connectors (only for ISDN TS Adapter IE).
- TAE6N plug (only for TS Adapter IE modem).

When using the analog TS Adapter IE outside Germany, a standard country-specific telephone plug can be snapped onto the RJ12 connector. A TAE6N connector is supplied for Germany. In some countries, telephone sockets with RJ12 sockets are available, in which case telephone cables can be used without the need for a telephone plug.

TS Adapter IE Basic

The TS Adapter IE Basic in SIMATIC S7-1200 design is optimized for operation with SIMATIC S7-1200. It can also be used with S7-300 and S7-400. The adapter has a modular design and comprises the following:

- Basic unit TS Adapter IE Basic
- TS module
  - TS module modem:
    contains an analog modem for the connection to the analog telephone network.
  - TS module ISDN:
    contains a terminal adapter for the connection to the ISDN network.
  - TS module RS232:
    With RS232 interface for connecting an external modem.
  - TS module GSM:
    contains a wireless modem for connecting to the GSM/GPRS network.

Only the combination of a basic unit TS Adapter IE Basic and a TS module forms a complete functional unit (total unit). Basic unit and TS module are connected via a connector and assembled together.

The functions of the TS Adapter are implemented in the basic unit. The basic unit has an Ethernet interface for connecting to PGs, PCs, or automation system. The basic unit is supplied with 24 V DC and grounded via a socket board.

The TS modules form the electrical interface to the telephone network. They are supplied with electricity from the basic unit through the shared connector.

TS Adapter IE Basic (basic unit) and the TS module can be installed differently:

- Installing on the S7-300 standard rail. This requires an optionally available standard sectional rail adapter.
- Installation on a standard rail
- Wall mounting
- Enclosure mounting

Scope of supply

The following are supplied with the basic unit TS Adapter IE Basic:

- DVD "SIMATIC TeleService Edition" with software and documentation
- Support collar for Ethernet plug

9

■ **Function**

TeleService is stand-alone software and does not require the installation of other software products such as STEP 7.

When using the TIA Portal, the TeleService software is not required because the functions are already a component part of the TIA Portal.

The following functions are available for remote maintenance with TeleService:

- Support for the TS Adapter II, TS Adapter IE and TS Adapter IE Basic.

- Parameterization of the modem:
  On the PG/PC side, parameterization using Windows tools is supported. On the line side, the TS Adapter (with default settings) performs parameterization.

- Electronic telephone book:
  To support the administration of plants (e.g. telephone number, location).

- Multi-level access protection:
  Prevents unauthorized connection build-up to a plant by means of a password and/or callback telephone number (callback function).

- Callback function:
  The plant calls the service center back automatically following a TeleService call.

- Routing of the PG functionality:
  Routing over TeleService is supported in the same manner as for a local connection. S7/M7 CPUs and CP modules with routing capability are required for this purpose.

- Import/export of the TS Adapter parameters:
  The parameters can be saved in a file (*.tap) on the PG/PC and reloaded.

- Authorization via the Automation License Manager.

- For use with Windows 2000, Windows XP Home and Windows XP Professional.

TS Adapter II; TS Adapter IE and TS Adapter IE Basic provide additional functions.

TS Adapter II:

- Establishing a connection from/to remote plants, e.g. for calling up process data from an automation system (PG-to-AS remote coupling).

- Exchange of data between plants (AS-to-AS remote link):

- Exchange of process data between two SIMATIC automation systems.

- Sending a text message:

- Sending a text message from a SIMATIC automation system via a GSM wireless modem.

TS Adapter IE:

- Remote control of HMI devices:
  The TS Adapter IE in combination with a browser installed on the PG/PC (e.g. Internet Explorer) and the Sm@rtViewer supports access over the telephone network to a SIMATIC HMI device with an installed Runtime option of WinCC flexible /Sm@rtService or /Sm@rtAccess. The HMI device or machine/plant can then be remotely controlled from the PG/PC.

- Sending e-mails:
  The function block AS_MAIL (included in the scope of supply of the adapter or TeleService V6.1) can be used to send e-mails directly from a SIMATIC CPU over the TS Adapter IE. The TS Adapter IE builds up an outgoing modem connection to a dial-up server for this purpose, e.g. to an Internet service provider, and sends the e-mails via an e-mail server that can be accessed there. If the provider offers the service for converting e-mails to text messages, text messages can also be sent in this manner.

- Standard routing:
  The TS Adapter IE allows a modem link to be established to an Internet service provider for accessing data on the Internet over this link. While the link is established, telephone dial-up and therefore remote maintenance and remote control is not possible.

TS Adapter IE Basic (in conjunction with a TS module):

- Remote maintenance over the telephone network:
  The TS Adapter IE Basic enables an application running on the PG/PC, such as STEP 7, to access Industrial Ethernet-connected S7 and C7 automation components over the phone network. For this, the TS Adapter IE Basic requires the following:
  - a connection to the automation components via Industrial Ethernet, and
  - a modem connection to the PG/PC.

- Sending e-mails:
  With the AS_MAIL function block, you can send e-mails from a SIMATIC CPU via the TS Adapter IE Basic. To do this, the TS Adapter IE Basic establishes an outgoing modem connection to a dial-up server, such as an Internet Service Provider (ISP), and sends the e-mails via a mail server accessible there.

To establish a remote connection through the telephone network you will alternatively need:

- TIA Portal V11.0 (contains all the necessary TeleService functions),

- TeleService V6.1 or

- Windows dial-up network

ECOFAST

ECOFAST

General data

◾ Overview

ECOFAST (Energy and Communication Field Installation System) connects the components of an automation system (such as switching and and control devices, I/O stations, motors and geared motors) using a uniform, standardized connection method for data and power.

ECOFAST is a solution for decentralization outside the control cabinet, with standardized connection methods for all components on a distributed installation basis, consistent for PROFIBUS DP and AS-Interface. ECOFAST sets standards in equipping machines and plants for automation, low-voltage controlgear and drives. ECOFAST is centered on the extensive decentralization and modularization of installations, combined with comprehensive diagnostics down to the component level.

Modern field and power bus technologies open up new possibilities for machinery and plant engineering. Decentrally conceived solutions are flexibly adaptable to the various applications in automated industrial tools.

This gives rise to advantages in terms of overall process costs. The standardized distributed installation technology with a high degree of protection (IP65) produces savings during

- Configuration
- Wiring
- Mounting
- Commissioning
- Operation

Features

- ECOFAST is a solution for a wide range of automation, drive and installation components with a high degree of protection.
- ECOFAST combines the components of an automation system with completely standardized connection methods for data and power according to ISO 23570.
- With ECOFAST, power and information are distributed and transmitted in a line.
- Parameters and control and diagnostics functionality are transmitted through PROFIBUS or AS-Interface for fast operation start-ups and troubleshooting.

Shorter time frames

With ECOFAST it is possible to shorten the time frames for the tendering, planning and configuring of machines and plants:

- Modular planning of machines and plants
- Compiling of tenders from ready-made modules
- Faster construction and mounting
- Cabinet-free construction with a high degree of protection
- Use of prefabricated and tested function units
- Faster installation on site
- Smaller plant footprints

Fast and smooth start-up

ECOFAST enables the fast and smooth start-up of automation and drive systems:

- Minimization of error sources through standardized interfaces and plug-in connectors
- Extensive diagnostics on the device and though the bus
- Improved EMC by direct coupling of switching unit and drive

High plant availability

ECOFAST maintains a high level of plant availability:

- Reduction of downtime thanks to the speedy and safe exchange of devices
- No interruption of the power and field bus while devices are being exchanged
- Automatic parameterizing when devices are exchanged
- Extensive status and diagnostics information
- Transmission of operating parameters (e.g. current values or status messages)

Components connected by ECOFAST

- Switchgear and control devices (direct-on-line starters, reversing starters, soft starters, frequency converters)
  - For near-motor or motor-mounted installation
  - As stand-alone device
  - As isolated solution
- I/O stations
- Motors and geared motors

For effective connection, installation components (cables, plugs, etc.) are used:
  - For communication
  - For power

ECOFAST in motor starters for operation in the field

The ECOFAST connection technology can be used to provide **power supply and communication** for motor starters for operation in the field:

- For ET 200pro motor starters
- For ECOFAST motor starters

The ECOFAST connection technology can be used for **power supply**:

- For M200D motor starters
- For MCU motor starters

The ECOFAST network topology

All interfaces for communication and power are completely standardized and comply with ISO 23570.

Communication via PROFIBUS DP (see page 10/4)

- Hybrid field bus connections (see page 10/5)
- PROFIBUS DP hybrid field bus cables (see page 10/7)
- Additional components (see page 10/10)
  - Hybrid plugs
  - Data T pieces
  - ECOFAST bus termination plug-in connectors

Communication via AS-Interface (see page 10/13)

- Yellow and black AS-Interface cable for data transmission (yellow) and auxiliary voltage (black)
- Connection of the AS-Interface cable by insulation piercing method

Power connection technology (see page 10/15)

- Power cables, plugs and power terminal connectors for the power supply (see page 10/16)
- Motor connection cables and plugs for the motor connection (see page 10/18)

(See figure "Schematic interface overview for ECOFAST network topology" page 10/3)

③ Signal processing (PLC/PROFIBUS master)
④ Safety technology

PROFIBUS DP network topology

Hybrid field bus connections

Hybrid field bus connections configured as control cabinet glands transmit data and power from the control cabinet (IP 20) into the field (IP65). They are the interface for jointly routing PROFIBUS DP and the auxiliary voltages into the hybrid field bus cable. The active hybrid field bus connections with signal refresher function can considerably increase the maximum PROFIBUS cable length when used in the field (see page 10/5).

Hybrid field bus cables

Four copper cores are available for the **transmission of voltage** in the hybrid field bus cables.

There are two transmission types for the **data transmission with PROFIBUS DP** in hybrid field bus cables:
- Electrically via two Cu-RS 485 copper cores
  (see ECOFAST hybrid field bus cables PROFIBUS DP in Cu-RS 485 page 10/7)
- Optically via two plastic fiber-optic cables
  (see ECOFAST Fiber Optic Hybrid Cable page 10/11

HanBrid plug-in connectors

The hybrid field bus cables are connected to the data T pieces via HanBrid plug-in connections.

Connection of the field devices to PROFIBUS DP

Data T pieces

PROFIBUS-DP connection
- Data T piece PROFIBUS-DP RS 485
- 4 x Han-Brid D male/female
  1.5 mm² for 10 A
  (2 x 24 V auxiliary voltage)
- 2 x Han-Brid D male/female

PROFIBUS-DP connection
- Data T piece PROFIBUS-DP FO
- 4 x Han-Brid D male/female
  1.5 mm² for 10 A
  (2 x 24 V auxiliary voltage)
- 2 x Han-Brid LWL male/female

Field device connection
- 25-pin Sub-D socket

Data T pieces

The data T pieces connect individual field devices to the ECOFAST hybrid field bus PROFIBUS DP. They ensure the interruption-free operation of the data bus when the field device is unplugged.

There are two T pieces in the ECOFAST system:
- Data T piece for PROFIBUS DP with copper cable (PROFIBUS DP RS 485) and 2 x 24 V auxiliary voltage (switched and non-switched)
- Data T piece for PROFIBUS DP with optical conductor (PROFIBUS DP FO) and 2 x 24 V auxiliary voltage (switched and non-switched)

■ Overview

Hybrid field bus connection socket/socket (HanBrid)

Hybrid field bus connection socket/socket (M12)

Hybrid field bus connections configured as control cabinet glands transmit data and power from the control cabinet (IP 20) into the field (IP65). They are the interface for jointly routing PROFIBUS DP and the auxiliary voltages into the hybrid field bus cable.

Passive and active hybrid field bus connections

The hybrid field bus connections are available in two versions which differ in their functionality. They are:

• The passive version
• The active version with signal refresher function to considerably increase the maximum PROFIBUS cable length

Connection methods

The field side is connected using HanBrid or M12 plug-in connectors.

In the case of HanBrid, the following versions are available:

• Socket/socket for infeeding into the field
• Pin/socket for looping in the field

The M12 version is generally configured with socket/socket.

Following connections are available at the rear (cabinet side) in the case of the passive glands:

• Direct connection
• FastConnect connection

The active gland with refresher function has 9-pole Sub-D sockets for the rear connection.

Auxiliary power infeed

The HanBrid plug-in design offers the possibility of infeeding or looping through not only the Profibus signal but also 2 separate auxiliary voltages of 24 V DC (switched/unswitched) into the field. The terminal block with spring-type terminals at the rear (cabinet side) of the hybrid field bus connection provides a variety of interconnecting operations for these auxiliary voltages.

Passive hybrid field bus connections

• Gland from the control cabinet (IP20) into the field (IP65)
• HanBrid plug-in design socket/socket or pin/socket
• Direct connection or Fast-Connect connection for PROFIBUS at the rear
• Terminal block with spring-type terminals (0.25 … 2.5 mm^2) for infeeding or looping through the auxiliary voltages

Hybrid field bus connection as passive control cabinet gland

Active hybrid field bus connections with refresher function

• Gland from the control cabinet (IP20) into the field (IP65)
• 3 independent, electrically separated Profibus segments
• Signal refresher function from and to all segments
• Automatic continuous baud rate detection
• Status/diagnostics displays with LEDs
• Cascading depth of a maximum 9 hybrid field bus connections
• HanBrid plug-in design socket/socket and pin/socket
• M12 plug-in design socket/socket
• 9-pole Sub D socket connection for PROFIBUS at the rear
• Terminal block with spring-type terminals (0.25 … 2.5 mm^2) for infeeding or looping through the auxiliary voltages

Hybrid field bus connection as active control cabinet gland with refresher function

Overview

ECOFAST Hybrid Cable PROFIBUS DP in Cu-RS 485

All devices running in the field are connected to the PROFIBUS DP with the ECOFAST bus cables.

The bus cable is configured as a hybrid cable and contains:

- PROFIBUS DP in Cu-RS 485;
- Four additional copper cores for transmission of the 24 V DC voltage:
  - 24 V DC, not switched (for electronics and inputs)
  - 24 V DC, switched (for outputs, can be switched off, e.g. on EMERGENCY-STOP)

The ECOFAST hybrid cables are available by the meter or in pre-assembled lengths with ECOFAST connectors (Han Brid) and sockets.

Connection technology according to ISO 23570 and ECOFAST

Overview

ECOFAST fiber-optic hybrid cable

The ECOFAST fiber-optic hybrid cable from SIMATIC NET is used for setting up optical PROFIBUS DP networks indoors.

The robust and trailing hybrid cable contains two plastic optical conductors for data transmission and four copper cables (1.5 mm^2) for the power supply of DESINA [1] stations.

It is particularly suitable for the connection of DESINA components installed near the machine and is easy to assemble on site. The maximum cable length between two DP units is 50 m.

- Hybrid cable for joint transmission of data and power supply
- Electrical separation of DP units
- Protection of the transmission path against electromagnetic faults
- Up to 50 m cable length with plastic optical conductor
- Robust fiber-optic cable, designed for industrial applications

[1] DESINA is the trademark for **DE**centralized (distributed) and **S**tandardized **IN**stall**A**tion technology on machine tools.

Overview

AS-Interface network topology

Key:
1. Auxiliary power supply
2. Main power supply (circuit-breaker, supply contactor, etc.)
3. Signal processing (PLC/AS-I master)
4. Safety technology (e. g. AS-I safety at work)

AS-Interface shaped cable

The two-core AS-Interface shaped cable is used in the communication via AS-Interface (see page 10/14):
- Yellow core for data transmission
- Black core for 24 V auxiliary voltage

Insulation piercing method

Connection is by means of the insulation piercing method which was developed especially for the AS-Interface (see page 10/14).

Connection at AS-Interface using insulation piercing method

ECOFAST
Connection technology according to ISO 23570 and ECOFAST

Communication via AS-Interface
AS-Interface shaped cable

■ Overview

AS-Interface shaped cable

The **Actuator-Sensor Interface (AS-Interface)** - the networking system used for the lowest field area - is characterized by very easy mounting and installation. A new connection method was developed specially for the AS-Interface.

The stations are connected using the AS-Interface cable. This two-wire AS-Interface shaped cable has a trapezoidal shape, thus ruling out polarity reversal.

Connection is effected by the **insulation piercing method**. In other words, male contacts pierce the shaped AS-Interface cable and make reliable contact with the two wires. Cutting to length and stripping are superfluous. Consequently, AS-Interface stations (e. g. I/O modules, intelligent devices) can be connected in the shortest possible time and exchanging devices is quick.

To enable use in the most varied ambient conditions (e. g. in an oily environment), the AS-Interface cable is available in different materials (rubber, TPE, PUR).

For special applications it is also possible to use an unshielded standard round cable H05VV-F 2x1.5 mm² according to AS-i Specification. With AS-Interface, data and energy for the sensors (e.g. proximity switches BERO) and actuators (e. g. indicator lights) are transmitted over the yellow AS-Interface cable.

The black cable must be used for actuators with a 24 V DC supply (e.g. solenoid valves) and a high power requirement.

Suitable for operation in tow chains

The use of the AS-Interface shaped cables with TPE and PUR outer sheath was checked in a tow chain test with the following conditions:

Chain length	m	6
Travel	m	10
Bending radius	mm	75
Travel speed	m/s	4
Acceleration	m/s²	4
Number of cycles		10 million
Duration of test		approx. 3 years (11 000 cycles per day)

After termination of the 10 million cycles only slight wear was visible due to the lugs of the tow chain. No damage to the cores and core insulation could be detected.

Note:

When using a tow chain, the cables must be installed such that they are not subject to tensile forces. On no account may the cables be twisted, but must be routed flat through the tow chain.

■ Selection and ordering data

	Material	Color	Quantity	Order No.
	AS-Interface shaped cables

■ Overview

Power supply to the motors via the power bus with power T and TT terminal connectors, spur lines to the field devices and power loop-through via motor connection cables

Power bus

The power supply to the field devices (ECOFAST motor starter, ET 200pro motor starter, M200D motor starter, MCU motor starter or frequency converter) is provided via the power bus, in which the power T terminal connector ② or power double-T terminal connector ③ are connected by power bus cables ①.

Feeders

From the terminal connectors, spur lines ④ with Han Q4/2 plugs lead to the field devices from which the motors are supplied with power via motor connection cables ⑦.

Interruption-free thanks to power terminal connectors

In finger-safe connection technology the power T connectors (② see page 10/17) and power TT terminal connectors (③ see page 10/17) connect the components of a feeder to the power bus. They ensure interruption-free operation, i.e. when the components are plugged in the power bus is not interrupted.

Motor connection cables

This section describes only the motor cables for the connection of the motor with Han10e plug-in connectors on the motor starter. (+ motor connection cables see page 10/18)

Han Q8 plug-in connectors on the motor starter are required:
- For ET 200pro motor starters
  (see Catalog ST 70, Accessories for ET 200pro motor starters)
- For M200D motor starters
  (see Chapter 6, Accessories for M200D motor starters)
- For MCU motor starters (see Chapter 6) the M screw is used for the load feeder.

Power feeder from power bus with spur line to the motor starter and motor cable for connection of the motor
- Connection via Han10e plug-in connection on the motor starter
  (for ET 200pro/M200D in HAN Q8 version)
- Connection via HanDrive/10e plug-in connector on the motor
- Motor connection cable as shielded or non-shielded
  design: Use of a frequency converter requires EMC shielding

ECOFAST
Connection technology according to ISO 23570 and ECOFAST

Accessories: ECOFAST selection module

■ Overview

ECOFAST selection module

The selection module enables the selective shutdown of feeders on the power bus, e.g. for servicing purposes. The module is equipped accordingly with a lockable switch (repair switch). In addition it provides line protection for cross sectional transitions on the power bus and can be used for increasing the size of the power bus segments.

Spectrum:
• Modules with 8, 16 and 25 A rated current
• With feedback contact through M12 plug
• Generally with 6 mm^2 wiring

Appendix

Appendix

Abbreviations, Explanations

Term	Meaning	Explanation
1		
10 Gigabit Ethernet	—	Standard for 10 Gbit/s data transfer using fiber-optic and copper cables
1000BASE	—	Gigabit Ethernet; standard for 1000 Mbit/s data transfer on copper cables
100BaseFX	—	Fast Ethernet Standard for data transmission on glass fiber-optic cables
100BaseT	—	Fast Ethernet Standard
10Base2	—	Standard for the transmission of 10 Mbit/s Ethernet on thin coaxial cables; segment length: 185 m
10Base5	—	Standard for the transmission of 10 Mbit/s Ethernet on coaxial cables (yellow cable); segment length: 500 m
10BaseFL	—	Standard for the transmission of 10 Mbit/s Ethernet on glass fiber-optic cables (fiber link)
10BaseT	—	Standard for the transmission of 10 Mbit/s Ethernet on twisted-pair cables
3		
3G	—	Third-generation mobile radio standard (see also UMTS) with significantly higher data transmission rates and global availability
A		
Access point	—	Access Points enable wireless LANs to be connected to wired Ethernet networks. The device also enables the range of individual wireless LAN components to be extended.
ACL	Access Control List	List with MAC addresses that are authorized to access the radio network
Actuator	—	Actuator
Ad-hoc network	—	Radio network between two WLAN clients or terminals (e.g. laptops) (point-to-point)
AES	Advanced Encryption Standard	Powerful encryption mechanism in radio networks for protection against eavesdropping and unauthorized access
AGVS	Automated guided vehicle system	Moving, driverless machine components
ALI	Application Layer Interface	Interface to application layer; this forms the interface between an application process and the standardized interface of the application layer and vice versa.
Antenna diversity	—	Procedure in which a radio receiver is equipped with two antennas and can choose the better of two received signals
Antenna gain	—	Improvement (passive!) of the antenna due to suitable design in comparison with an isotropic radiator
ASIC	Application Specific Integrated Circuit	Application-specific IC
AS-Interface	Actuator-sensor interface	Cable for direct connection of simple binary sensors and actuators (transmission of small quantities of information)
ASPC 2	Advanced Siemens PROFIBUS Controller of the 2nd Generation	ASIC used in master modules of PROFIBUS interface modules for transmission rates up to 12 Mbit/s
ATEX	—	Approval for explosion-proof areas
ATM	Asynchronous Transfer Mode	Method by which the data traffic is transmitted in smaller packets of fixed length and by means of asynchronous time division multiplexing
AUI	Attachment Unit Interface	Interface compliant with IEEE 802.3
Autocrossover	—	Function that enables automatic crossover of send and receive cables at twisted pair interfaces.
Autonegotiation	—	Configuration protocol for Fast Ethernet. Before initiating the actual data transmission, network devices automatically negotiate a transmission mode (100 Mbit/s or 10 Mbit/s, full duplex or half duplex).

11

Appendix

Term	Meaning	Explanation
A		
Autosensing	—	Ability of a device to detect the data rate automatically (10 Mbit/s or 100 Mbit/s) and to then send or receive at this rate.
AWG	American Wire Gauge	US standard. Also known as Brown and Sharp (B&S) Wire Gauge. It specifies the diameter of copper conductors.
B		
BERO	Contactless proximity limit switch with feedback oscillator	Proximity switch
BFOC	Bayonett Fiber Optic Connector	Standardized connector for glass fiber-optic cables with a bayonet-lock; also referred to as "ST" (see ST connector)
BRECV	—	Block-oriented reception of data
Bridge	—	A network component that interconnects network segments. It ensures that local data traffic remains local, i.e. that only data packets addressed to a node in another segment are forwarded. Faults in one network segment are restricted to that segment. In contrast to switches, bridges can only handle one data flow at a time. Bridges no longer have any market relevance.
Broadcast	Circular call in a computer network	Message, with which data packets are transmitted from one point to all stations in a network
BSEND	—	Block-oriented transmission of data
bursts	—	Momentarily increased network loading due to a data surge or alarm avalanche
C		
Category x components	—	Cabling components are divided into various categories depending on their transmission properties. Various physical limit values have been established for the individual categories (e.g. maximum signal attenuation at a defined transmission frequency). Category 3: Data transmission up to 16 MHz. Category 4: Data transmission up to 20 MHz. Category 5: Data transmission up to 100 MHz. Category 6: Data transmission up to 200 MHz (draft standard)
CBA	Component Based Automation	Supports modularization in mechanical and plant engineering through the plant-wide, graphical grouping of distributed applications. Component based Automation based on the PROFINET standard of the PNO.
CC	Central controller	—
CD	Compact disc	—
CSD	**C**ircuit **S**witched **D**ata	Data transmission over a GSM dialup connection
CHAP	Challenge Handshake Authentication Protocol	Authentication protocol
Channel Bonding	—	Two channels are used simultaneously with the help of channel bonding. Gross transmission rates of up to 450 Mbit/s can be achieved in conjunction with the MIMO technology in accordance with IEEE 802.11n.
CI	Cyclic interface	—
CM	Communications Metallic	UL approval for copper cables for use in buildings in accordance with Section 800-53(d) of NEC. Flames do not spread upward from cable out of the cable tray in the Vertical Tray Flame Test in UL 1685, "Vertical-Tray Fire-Propagation and Smoke Release Test for Electrical and Optical-Fiber Cables".
CM	Communication Module	Module for communications tasks used in an automation system as a CPU interface expansion

11

Appendix

Abbreviations, Explanations

Term	Meaning	Explanation
C		
CLI	Command Line Interface	Alphanumeric command interface for parameterization and diagnosis over a serial interface or TELNET
CLID	Calling Line Identification	Service feature
Client/server communication	Principle of connection setup	The network node that sets up a connection is termed the "client". A "server" on the other hand is the node to which a connection is set up.
CMG	—	UL Approval of a copper cable for laying in cable harnesses (general purpose)
CMIP	Common Management Information Protocol	—
CMIS	Common Management Information Service	—
CMP	Plenum cable (copper)	UL Approval of a copper cable for laying without additional protection in the space above dropped ceilings or below raised floors
CMR	Riser cable (copper)	UL Approval of a copper cable for laying between the floors of a building
CMX	—	Cable for use in buildings in a cable duct or non-flammable tube. The unprotected lines or cables must not exceed 3 m in length. CMX type cable may bear the title "Outdoor". This cable meets all the conditions of the VW-1 Flame Test Requirements as defined in UL 1581.
CoL	Certificate of License	Certificate accompanying a software product which documents the legal ownership of a software license.
Collision domain	—	In order to ensure the function of the Carrier Sense Multiple Access / Collision Detection (CSMA/CD) procedure, the delay of a data package from one station to the other is limited. Depending on the transmission rate, this delay gives a physically limited expansion of the network, known as the collision domain. For 10 Mbit/s Ethernet this is 4520 m, and for Fast Ethernet 412 m. Several collision domains can be connected with each other via bridges/switches. Full duplex permits expansions beyond a collision domain.
COM/DCOM	Component Object Model / Distributed Component Object Model	COM is a fundamental object model. It allows an object to make its functionality available to other components. DCOM is an extension of COM for communication over a network.
CP	Communication Processor	Interface module for communication tasks
CPU	Central Processing Unit	e.g. for SIMATIC S5/S7
CSD	Circuit Switched Data	Modem operation
CSMA/CD	Carrier Sense Multiple Access/Collision Detection	Collision access procedure for Industrial Ethernet bus systems as per IEEE 802.3
D		
DA	Destination Address	—
Data objects	—	Programming-related display of EIB bus nodes for the EIB configuration software ETS 2. Data objects can be linked to each other and represent the states of the EIB bus nodes. A bus node can comprise several data objects.
dBi	—	Unit of measurement of antenna gain compared to an isotropic omnidirectional antenna
DCP	Discovery and Configuration Protocol	Defines the allocation of the IP parameters with vendor-specific configuration/programming tools or in the plant-wide engineering, e.g. in the PROFINET interconnection editor

11

Appendix

Term	Meaning	Explanation
D		
DDE	Dynamic Data Exchange	Windows interface
DDL	Direct Data Link	—
DDLM	Direct Data Link Mapper	—
Deterministic features	—	Predictable data traffic and defined response times
DHCP	Dynamic Host Configuration Protocol	De-facto standard for assigning dynamic IP addresses
Diversity	—	Radio receiver with two antennas for selecting the best signal
DLL	Dynamic Link Library	A collection of functions available to two or more programs, but which are loaded only once into the memory (Windows/Windows NT Feature).
DLPI	Data Link Protocol Interface	—
DNP3	Distributed Network Protocol	Communications standard for telecontrol systems; it is used as general transmission protocol between control station and sub-station
Domain services	—	An application service group which contains services for downloading/uploading of logically related memory areas.
DP	Distributed I/O	Input or output modules that are used by the CPU on a distributed basis. The PLC and the distributed I/O can be connected over the PROFIBUS DP bus system.
DPRAM	Dual Port Random Access Memory	—
DSSS	Direct Sequence Spread Spectrum	Spread spectrum transmission procedure (IEEE 802.11b)
DV	Data processing	Previously also referred to as Electronic Data Processing (EDP)
DVD	Digital Versatile Disk	Digital optical storage medium
E		
EEMS	Extended electromechanical interface	—
EGPRS	Enhanced GPRS	Method of increasing the data rate in GSM mobile networks by introducing an additional modulation procedure
EIB	European Installation Bus	Registered trademark of the European Installation Bus Association, Brussels
EIRP	Equivalent isotropic radiated power	The transmit power that must be fed to an isotropic radiator in order that it effectively emits the same performance as another antenna in a specific direction. An isotropic radiator is a theoretical antenna that radiates evenly in all directions (isotropically) and is assumed to be infinitely small.
E-mail	Electronic mail	Electronic mail for data transfer between computers, mobile telephones and pagers. E-mails can be sent by the user or automatically generated.
EMC	Electromagnetic compatibility	—
ER	Extension rack	Expansion component for SIMATIC
ERP	Enterprise Resource Planning	Term for systems and software solutions which coordinate the business process and help with planning, e.g. SAP R3, Peoplesoft, BAAN.
ERTEC	Enhanced Real-Time Ethernet Controller	The Industrial Ethernet ASIC is a high-performance Ethernet controller, optimized for PROFINET with integral switch functionality and processor

11

Appendix

Abbreviations, Explanations

Term	Meaning	Explanation
E		
ESD	Electro static discharge	Electric strength
EU	Extension unit	—
Ex	Intrinsically safe protective measure to DIN EN 50 020	Appropriately marked modules may also be used within hazardous areas. (Regulations must be observed!)
F		
FB	Function block	—
FC	FastConnect	Fast connection system for Ethernet and PROFIBUS cables and connectors
FC	Function Call	Sequence of functions
FDDI	Fiber Distributed Data Interface	High-speed network standardized by ANSI for data transmission over a range of up to 100 km with a bit rate of 100 Mbit/s. Twin fiber-optic cables in opposite directions serve as the transmission medium.
FDL	Fieldbus Data Link	Layer 2 with PROFIBUS; it comprises the field bus link control (FLC) and medium access control (MAC).
FDX	Full duplex	Capability of a device for sending and receiving data at the same time. In the case of full duplex, collision detection is deactivated. A full duplex capable device is able to buffer data packets.
FE	Fast Ethernet	Compared with 10 Mbps Ethernet, frames at 100 Mbps are transported much faster and therefore occupy the bus for a very short time.
Fetch	—	Fetching data from remote stations
FHSS	Frequency Hopping Spread Spectrum	Transmission procedure used, for example, in Bluetooth.
Filtering	—	A switch filters data traffic depending on the source and destination addresses in a data packet. An incoming data packet is routed by the switch to the port to which the data terminal with the appropriate destination address is connected.
FIFO principle	"First in, first out" principle	Data is transmitted in telecontrol systems regardless of the respective priority
FIM	Field Interface Module	—
Firewall	—	One or more computers which permit or block access to data on interconnected networks in accordance with prescribed security restrictions.
FM	—	US certificate for the installation of devices in hazardous locations (Factory Mutual Research)
FMS	Fieldbus Message Specification	Upper sublayer of Layer 7 with PROFIBUS; it encompasses the functions: protocol machine, generation of PDUs, coding/decoding and interpretation of the protocol data unit.
FO	fiber-optic	Fiber-optic cable
FO cable	Fiber-optic cable	Flexible optical medium/fiber made of glass or plastic in which light can be conducted in a controlled manner
Forced Roaming	—	Automatic roaming if the cable connection to the access points is broken
FRNC	Flame Retardent Non Corrosive	Flame-retardant, halogen-free cladding material for a cable

11

Appendix

Term	Meaning	Explanation
F		
Full duplex	—	Capability of a device for sending and receiving data at the same time. In the case of full duplex, collision detection is deactivated.
Functional grounding	—	Function for internal ground monitoring used for protection against hazardous touch voltages
G		
Gateway	—	Intelligent connection between a local network and an external network with a completely different structure
GFK	Glass-fiber reinforced plastic	—
GHz	Gigahertz	Unit of frequency, e.g. 2.4 GHz
Gigabit Ethernet	—	Gigabit Ethernet (1 Gbit/s) is faster than Fast Ethernet by a factor of 10, occupying the bus for only one tenth of the time.
GMRP	GARP (Generic Attribute Registration Protocol) Multicast Registration Protocol	GMRP enables switches to control the forwarding of multicast messages. A host logs in or out for a multicast address. Accordingly, the managing switch forwards corresponding multicasts to the host or not. This constrains the flooding of multicasts and reduces the network load.
GP	General Purpose	UL listing (safety standard) for network cables is especially necessary for the American and Canadian markets. The requirements for the appropriate approvals depend on where the cable is routed within the building. This applies to all cables which have to be routed from a machine to a remote control cabinet and are positioned on cable racks secured on the building.
GPRS	General Packet Radio Service	A packet of networking mobile communications services based on GSM channels. GPRS enables fast communication at high transmission speeds and is chiefly of interest for mobile Internet access.
GPS	Global Positioning System	Satellite-supported system for determining the position of a GPS receiver. A GPS receiver can be localized precisely anywhere in the world using three of the total of 24 satellites. GPS receivers are typically built into navigation systems.
GSD	General Station Description	A GSD contains an XML-based description of the properties of IO devices such as communications parameters as well as number, type, configuration data, parameter and diagnostics information of modules
GSM	Global System for Mobile Communication	Global standard for mobile communication
GVRP	Generic VLAN Registration Protocol	–
H		
HARDNET	—	Software based on communications modules with internal microprocessor
HART	Highway Addressable Remote Transducer	Protocol for bus-addressed field devices; it is not a fieldbus, but a version of the digital field communication that contains many of the functionalities of fieldbuses
HCS	—	Trademark of Spectran Specialty Optics
H-communication	Fault-tolerant communication	Fault-tolerant, redundant communication with SIMATIC S7-H systems
HDX	Half Duplex	A device can either receive or send data at a given time.
HMI	Human Machine Interface	Operator control and process monitoring products/systems at Siemens
HSR	High Speed Redundancy	The HSR redundancy procedure is based on Hiper-Ring, a ring redundancy protocol developed by "Hirschmann Automation and Control" and Siemens and introduced in 1999.

11

Appendix

Abbreviations, Explanations

Term	Meaning	Explanation
H		
HTB	Data handling block	HTB are standard function blocks that allow data transfer between boards outfitted with page frame addresses.
HTML	Hypertext Markup Language	Descriptive language for WWW (World Wide Web) pages
HTTP	Hypertext Transfer Protocol	Transmission protocol for Web pages on the Internet
Hub	—	Active network component with repeater functional scope, synonym for star coupler
I		
ICMP	Internet Control Message Protocol	Additional protocol on the Internet layer, alongside the Internet Protocol (IP); this is used to exchange error and information messages in IP, TCP, and UDP protocols. ICMP packets are always sent as IP datagrams. This serves to inform hosts of more favorable routes to a destination, provide information about routing problems, and break off connections due to problems in the data network. The ping and traceroute commands are based on ICMP. ICMP messages are divided into two classes: error messages and information messages.
IE	Industrial Ethernet	Cell network according to the international IEEE 802.3 (Ethernet) standard, designed for the industrial environment
IEC	International Electrotechnical Commission	Authority that oversees standardization in electrical engineering
IEEE	Institute of Electrical and Electronics Engineers	—
IEEE 802	Institute of Electrical and Electronics Engineers	LAN/WAN Standards Committee
IEEE 802.11	Institute of Electrical and Electronics Engineers	Standard for radio networks in the 2.4 GHz range with data rates up to 2 Mbit/s.
IEEE 802.11a	Institute of Electrical and Electronics Engineers	Standard for radio networks in the 5 GHz range with data rates up to 54 Mbit/s.
IEEE 802.11b	Institute of Electrical and Electronics Engineers	Standard for radio networks in the 2.4 GHz range with data rates up to 11 Mbit/s.
IEEE 802.11g	Institute of Electrical and Electronics Engineers	Standard for radio networks in the 2.4 GHz range with data rates up to 54 Mbit/s. Backward compatible with IEEE 802.11b.
IEEE 802.11i	Institute of Electrical and Electronics Engineers	Expanded safety architecture for the 802.11 standard, valid for IEEE 802.11a/b/g; includes TKIP and AES
IEEE 802.11n	Institute of Electrical and Electronics Engineers	The IEEE 802.11n standard uses the MIMO (Multiple In, Multiple Out) technique for data transmission. The expansion of transmission channels from 20 MHz to 40 MHz and the use of three antennas increases the gross data rate to 450 Mbit/s.
IEEE 802.3	Institute of Electrical and Electronics Engineers	Ethernet working group
IEEE 802.3af	Institute of Electrical and Electronics Engineers	Standard that defines the transmission of power and data over one cable (see Power-over-Ethernet)
IEEE 802.3u	Institute of Electrical and Electronics Engineers	Fast Ethernet working group
IGMP	Internet Group Management Protocol	Protocol for load limiting when using multicast-based protocols, e.g. for video monitoring
IM	Interface modules	Interface

11

Term	Meaning	Explanation
I		
INA	Intel Network Architecture	—
instabus	—	*instabus*® is a registered trademark of Siemens AG which members of the "Insta Association" are also authorized to use
Intrinsically safe	—	Ex protection measure according to DIN
I/O	Input/Output	—
IO Controller	—	Controller for PROFINET IO in which the automation program executes
IO Device	—	Distributed field device that is assigned to an IO controller
IO supervisor	—	PG/PC with commissioning and diagnostics functions for PROFINET IO
IP	Internetwork Protocol	On its own, the IP protocol is without connections and invalid. The most important information is the unique IP address. The blocks of data are sent to the destination computer independently. IP does not negotiate anything with the destination computer. An end-to-end error check is not performed. Frames can arrive in a different order from the order they were sent in. TCP is responsible for rearranging them in the correct sequence.
IP Alive	—	Monitoring function for IP connections
iPCF	Industrial Point Co-ordination Function	Functional expansion of the IEEE 802.11 standard for applications with a requirement for real-time and deterministics (predictable response times). This facilitates rapid roaming of moving stations from one radio cell to the next and supports secure, wireless PROFINET IO communication with the SIMATIC Mobile Panel 277F IWLAN.
iPCF-MC	iPCF Management Channel	A further development of iPCF; this mode should be used if IWLAN stations that also support iPCF-MC move freely about in the coverage area (especially when using omni-directional antennas) and are to exchange data deterministically.
IPX	—	Protocols of ISO layers 1–4
IP20	—	Device protection class; protection against contact with the fingers and against penetration by solid foreign bodies with diameters in excess of 12 mm; no particular protection against water
IP30	—	Device protection class; protection against contact with tools, wires etc. with diameters in excess of 2.5 mm and against penetration by solid foreign bodies with diameters in excess of 2.5 mm; no particular protection against water
IP65	—	Device protection class; complete protection against contact and against ingress of dust; protection against splash water from all directions
IRT	Isochronous real time	Deterministic and isochronous real-time communication for PROFINET for the particularly stringent demands, for example, of motion control applications. Clock rates of less than 1 ms can be achieved by using corresponding hardware.
ISA	Industry Standard Architecture	—
ISDN	Integrated Services Digital Network	Digital network that integrates services
ISM-Band	Industrial, Scientific and Medical-Band	Frequency band for license-free use
ISO	International Organization for Standardization	International Standards Organization

11

Appendix

Abbreviations, Explanations

Term	Meaning	Explanation
I		
ISP	Internet Service Provider	Internet services provider
IT	Information Technology with e-mail and web technology at Siemens	Acquisition, conditioning, transmission, distribution, utilization and processing of information
ITC	Instrumentation Tray Cable	Approval for IE FC TP standard cable
ITP (Category 5)	Industrial Twisted Pair	Highly efficient, shielded, twisted pair cable for universal applications (international cabling standard ISO/IEC 11801 and EN 50173)
IWLAN	Industrial Wireless LAN	Industry standard WLAN conforming to IEEE 802.11 standard
J		
JVM	Java Virtual Machine	Java is a cross-platform, object-oriented programming language similar to C++. The Java Compiler, however, does not generate native machine code, but a byte code that has to be interpreted. This is done with the aid of the "Java Virtual Machine".
K		
KNX	Konnex (EN 50090, ANSI EIA 776)	Universal bus system for all house and building systems; KNX was developed by the Konnex Association based on EIB (European Installation Bus).
L		
LAN	Local Area Network	Local area network
Layer 3 Routing	—	Function for communication between various IP subnetworks on the basis of Layer 3. Also referred to as IP routing.
LED	Light Emitting Diode	Light emitting diode
Link Aggregation	—	Procedure for bundling several physical interfaces into one logical channel. Used for increasing the data throughput between two Ethernet switches. Implementations can also link servers and other systems by means of link aggregation.
Link Check	—	Cyclic monitoring of a radio link
Link Class	—	In the link class, the quality of a complete connection (link) is described, from the active component to the data terminal (patch cable, patch field, installation cable, connection socket, connecting cable). This link must comply with the values specified in the standard for structured cabling ISO/IEC 1180. Contrary to this is the specification according to "categories" where only product requirements are defined, e.g. category 5 cable.
LLC	Logical Link Control	Standardized network protocol
LLDP	Link Layer Discovery Protocol	This is a multi-vendor protocol for topology support on the link layer which enables a device connected to an Ethernet to advertise its identity and properties to other devices. This information is stored in the management information base (MIB) and collected using the simple network management protocol (SNMP).
LLI	Lower Layer Interface	Part of layer 7 with PROFIBUS, in which layer 7 services are mapped onto layer 2 services
Load decoupling	—	Due to filtering, a switch ensures that local data traffic remains local. Local network loading of a segment is decoupled from the remainder of the network.
L2TP	Layer 2 Tunneling Protocol	—

11

Abbreviations, Explanations

Term	Meaning	Explanation
M		
MAC	Media Access Control	Bus access control
MAN	Metropolitan Area Network	Data network with the geographical range of a town
MAP	Manufacturing Automation Protocol	International standard for automation protocols
Media redundancy	—	Redundancy in the network infrastructure (cable and active components such as OLM or OSM/ORM)
MIB	Management Information Base	A file for generating device profiles; it enables other SNMP-enabled devices, for example, to be integrated into the OPC configuration through loading of MIBs in accordance with the SMI V1 and SMI V2 standard from STEP 7 V5.4
MIMO	Multiple Input, Multiple Output	Multiple path propagation in accordance with the international standard IEEE 802.11n. This allows the devices to use several antennas in parallel in order to achieve a higher transmission rate and reduce susceptibility to faults in environments with a high number of reflections.
MMS	Manufacturing Message Specification	User interface of MAP
Monoprotocol	—	Data can only be transferred through one protocol
MPI	Multi Point Interface	Multipoint-capable interface for SIMATIC S7
MRP	Media Redundancy Protocol	The Medium Redundancy Protocol (MRP) is based on a ring topology and guarantees reconfiguration times of 200 ms
Multicast	—	Multicast or Group calling in telecommunications signifies Message transmission from one point to a group (also termed Multipoint connection). The advantage of multicasting is that messages can be sent simultaneously to several stations or to a closed user group, without multiplying the bandwidth at the transmitting end by the number of recipients.
Multiple path propagation	—	Reflections of a radio wave off different objects in a room. This causes the radio wave to arrive at the receiver with variations of intensity and delay
Multiplex function	—	Multiplex function (with OP communication) increases the number of OPs that can be connected to a SIMATIC S7-300
Multi-protocol	—	Data can be transferred through one or two protocols
N		
NAT	Network Address Translation	Translation of private IP addresses into public addresses
NC	Numerical Control	Numerical control (machine tools)
NCM	Network and Communication Management	Tool for configuring communication connections, also a component of STEP 7
NDIS	Network Driver Interface Specification	Microsoft and 3Com interface
NEC	National Electrical Code	UL directive for the laying of cables in buildings
NIC	Network Interface Card	Line connection
N-measurement	—	Device installation measurement for subdivisions of the electrical installation
NTP	Network Time Protocol	Standardized protocol for synchronization of clocks in Computer systems overCommunication networks
O		
ODI	—	NOVELL interface
OFDM	Orthogonal Frequency Division Multiplex	Modulation procedure for IEEE 802.11a/g

11

Appendix

Abbreviations, Explanations

Term	Meaning	Explanation
O		
OFN	Optical Fiber Non-conductive	UL approval for fiber optic cables for use in buildings in accordance with Section 800-53(d) of NEC. Flames do not spread upward from cable out of the cable tray in the Vertical Tray Flame Test in UL 1685, "Vertical-Tray Fire-Propagation and Smoke Release Test for Electrical and Optical-Fiber Cables".
OFNG		UL Approval of a fiber optic cable for laying in cable harnesses (general purpose)
OFNP	Plenum cable (FOC)	UL Approval of a fiber optic cable for laying without additional protection in the space above dropped ceilings or below raised floors
OFNR	Riser cable (FOC)	UL Approval of a fiber optic cable for laying between the floors of a building
OLE	Object Linking and Embedding	Central architecture principle in Windows for the generation and editing of documents that contain objects generated by different applications
OLM	Optical link module	Network component for PROFIBUS
Omnidirectional	—	Antenna that radiates evenly through 360 degrees in both horizontal and vertical planes
OP	Operator Panel	—
OPC	Openness, Productivity, Collaboration	Standard interface for access to process data
OPC DA	OPC Data Access	Standard for Ethernet-based access to data of measurement and control devices, for the location of OPC servers and the simple browsing in the name spaces of the OPC servers on the basis on client/server communication
OPC UA	OPC Unified Architecture	OPC UA is the further development of the standard interface OPC and provides additional functions such as security and redundancy.
OSPF	Open Shortest Path First	Dynamic routing
P		
PA	Process Automation	Protocol profile, based on PROFIBUS DP with intrinsically safe transmission system to IEC 61158-2
PAN	Personal Area Network	Comparable with an ad-hoc network, for networking individual small devices a short distance from each other.
PAP	Password Authentication Protocol	Password authentication protocol
PAT	Port Address Translation	Translation of private ports into public addresses
PCF	Polymer cladded fiber	Plastic-enclosed glass fiber
PCI	Peripheral Component Interconnect Express	Backplane bus in personal computers
PCIe	Peripheral Component Interconnect Express	Backplane bus in PC with, for example, a higher data transmission rate than the predecessor PCI
PCMCIA	Personal Computer, Memory Card, International Association	Standard for PC plug-in cards (credit card size). PCMCIA cards (Personal Computer Memory Card International Association) are used mainly input/output operations (e.g. modem) or memory expansions.
PCS 7	—	Siemens process control system
PDU	Protocol Data Unit	Protocol data unit
PG	Programming device	—
PI	Program instance	Communication object
PLC	Programmable logic controller	Device for open and closed loop control tasks
PN	PROFINET	Industrial Ethernet standard defined by the PNO

11

Appendix

Term	Meaning	Explanation
P		
PNO	PROFIBUS Nutzerorganisation e.V.	Organization for PROFIBUS users and providers
PoE	Power over Ethernet	Transmission of power and data on a single cable
POF	Polymer optic fiber	Fiber optic cable made of light-conducting plastic
Polling	—	Addressed transmission call in centrally-oriented data networks polling mode. The poll is the command to a specific station to send messages. In this way the poll sequences control the data flow.
POP	Point of Presence	Dial-in node for an Internet service provider
PP	Push Button Panels	—
PPM	Parts per million	—
PPTP	Point-to-Point Tunneling Protocol	—
Process or field communication	—	Process or field communication is used for linking actuators/sensors to a CPU.
PROFIBUS	Process Field Bus	International fieldbus standard according to IEC 61158/61784
PROFIBUS DP	PROFIBUS DP for distributed I/O	Protocol profile according to IEC 61158/61784 for process or field communication for fast, cyclic data exchange with field devices
PROFIBUS PA	PROFIBUS for process automation	Protocol profile, based on PROFIBUS DP with intrinsically safe transmission system to IEC 61158-2.
PROFIdrive	—	PROFIBUS protocol profile, based on PROFIBUS DP, driven engineering profile (version 3, clock synchronization)
PROFIenergy	—	Protocol profile that provides functions and mechanisms for PROFINET field devices that support energy-efficient production
Profile	—	Definition of options and parameters as a supplement to the standard, e.g. PROFIBUS profiles
PROFINET	—	Industrial Ethernet standard defined by the PNO
PROFINET device with proxy functionality	—	A PROFINET device that takes on the role of the master with regard to PROFIBUS devices. This makes it possible to link PROFIBUS slaves into the PROFINET communication. If the device has a local (internal) PROFIBUS, it has the role of DP master with regard to the local DP slaves.
PROFIsafe	—	Protocol profile in accordance with IEC 61508 that permits standard and safety-related communication on a bus. Communication between fail-safe controllers and fail-safe I/O is handled by PROFIsafe.
Protocol	—	Procedural regulation for data transmission. This regulation specifies both the message formats and the data flow during data transmission
Proxy	—	Representative object in the object model that maps the PROFINET view onto a field device or a group of field devices. The proxy on the PROFINET is the representative for one or more PROFIBUS devices
PST	Primary Setup Tool	Software tool for assigning IP addresses
PUR	Polyurethane	—
R		
RADIUS	Remote Authentication Dial-In User Service	Access control by means of servers
RAM	Random Access Memory	Random access memory

11

Appendix

Abbreviations, Explanations

Term	Meaning	Explanation
R		
Rapid Spanning Tree Protocol	Configuration protocol specified in the IEEE-802.1w standard	The rapid spanning tree protocol is a further development of the spanning tree protocol (STP). It is used to avoid redundant network paths (loops) in the LAN, specifically when using switches; the reconfiguration time ranges from 2-3 seconds.
RBC	Remote Base Controller	—
RegTP	—	Regulation authority for telecommunications in Germany
Remote diagnostics and remote maintenance (teleservice)	—	Teleservice is data exchange with physically remote technical plants (machines, plants, computers, etc.) for the purpose of error detection, diagnostics, maintenance, repair, or optimization.
Requirement specification	Automation Protocol	Layers 5 through 7 of the ISO reference model
RIPv1/2	Routing Information Protocol	—
RJ45	Symmetrical connector for data cables	This is also known as a western connector or a western plug. This is a widely used plug connector in telephone and ISDN technology which is used in LAN installations in the office environment.
RM	Redundancy manager	Function for monitoring the network; the RM detects the failure of a transmission link in the ring or of a switch and activates the standby link
RMON	Remote Monitoring	Network administration function, e.g. collection of statistics information
Roaming	—	Free movement of wireless LAN stations across the cell boundaries of an access point. The station can switch from one radio cell to the next without any noticeable interruption
R-SMA	—	Reverse-SMA, connector for antennas in IWLAN
RSTP	Rapid Spanning Tree Protocol	The rapid spanning tree protocol is a further development of the spanning tree protocol (STP). The spanning tree protocol (STP) is used for avoiding redundant network paths (loops) in the LAN, specifically in switched environments; the reconfiguration time is in the range of 2–3 seconds.
RT	Real-time	Real-time communication in PROFINET
S		
SA	Source Address	Part of the IP header; contains the source address of the IP packet; 32 bits wide
SAP	Service Access Point	Service access point: an interface allowing the user to access services of the lower layer
SC connection technology	—	Standardized connection for glass fiber optic cables
SC RJ connection technology	—	Standardized connection for fiber optic conductors, e.g. for POF and PCF fiber optic cable
SDA service	Send Data with Acknowledge (open Layer 2 access)	Sending of acknowledged Layer 2 services
SDN	Send Data with No Acknowledge (open Layer 2 access)	Sending of unacknowledged Layer 2 services (broadcast, multicast)
SFB	System Function Block	A System Function Block (SFB) is a function block that is integrated in the S7 CPU. Because SFBs are part of the operating system, they are not loaded as part of the program. SFBs are blocks with a "memory". Instance data blocks must also be generated for SFBs and loaded as part of the program into the CPU
SFC	System function calls	Calls that are integrated into the operating system of the CPU, e.g. time functions or block transfer
SFM	System error signaling concept of SIMATIC	—

11

Term	Meaning	Explanation
S		
SFP	Small Form-factor Pluggable (coll. mini-GBIC)	Small standardized modules for network connections. SFPs are modular optical or electrical transceivers that are constructed as cable connectors in an SFP slot for extremely fast Ethernet. Network devices can therefore be easily changed to other media and the transceivers can be quickly replaced in the event of an error.
Shared LAN	—	All components in a shared LAN share the nominal data transmission rate. Shared LANs are constructed with repeaters/hubs.
Signal delay	—	Time that a data packet takes to travel through the network
Slot Time	—	Time elapsing between transmission of a call and reception of an answer or acknowledgment
SM	Signal module	Input and output modules for SIMATIC
SMTP	Simple Mail Transfer Protocol	Transmission protocol for e-mail
SNMP	Simple Network Management Protocol	Standardized protocol for the transport of network management information
SNTP	Simple Network Time Protocol	Standardized protocol for synchronization of clocks in Computer systems overCommunication networks
Socket interface	Standard communication for Industrial Ethernet	This facilitates data communication with computers through TCP/IP. On this interface, which is widespread in the PC and UNIX world, users can freely program their own protocols. The SEND/RECEIVE blocks are used as access to TCP/IP in SIMATIC S7.
SOFTNET	—	Software based on simple communications modules
SP	Service packs	Data that can easily be downloaded free of charge from the Internet.
Spanning Tree Protocol	Bridge configuration protocol specified in the IEEE-802.1d standard	The Spanning Tree Protocol is used to eliminate loops in any meshed networks. The reconfiguration time is in the region of 30 s.
SPC	Siemens PROFIBUS Controller	—
SSID	Service Set Identifier	Identification of a wireless network based on the IEEE 802.11 standard
S/STP	Screened Shielded Twisted Pair	In this cable construction the individual twisted pairs are wrapped in a foil shield. The two individually shielded pairs of conductors are then wrapped together in a braided copper shield.
Standby function	—	Function for redundant coupling network segments, such as for the coupling of redundant ring structures
ST connector	Straight-tip connector	Standardized connector for glass fiber-optic cables with bayonet lock (ST is a registered trademark of AT&T)); see BFOC
STP	Spanning Tree Protocol (IEEE 802.1d Standard)	The Spanning Tree Protocol is used to eliminate loops in any meshed networks. The reconfiguration time is in the region of 30 s.
Switching	—	Establishing several links between the ports simultaneously. These links are established dynamically and temporarily in accordance with the data traffic.
SWR	Standing Wave Ratio	Ratio between the energy radiated by an antenna and the energy that the antenna reflects to the radio module
S$_0$ interface	—	Basic interface for ISDN for connecting data terminals
S7 routing	—	PG/OP communication via different networks
T		
TCP/IP	Transport Control Protocol/Internet Protocol	De-facto standard; Protocol for worldwide communication with the Ethernet.

Appendix

Abbreviations, Explanations

Term	Meaning	Explanation
T		
Telecontrol	—	The connection of distant process stations to one or more central control systems. Various different public or private networks can be used for communication for the purposes of monitoring and control. Event-driven or cyclic exchange of process data is performed with special telecontrol protocols and enables the operating personnel to manage the overall process effectively.
Teleservice (remote diagnostics and remote maintenance)	—	Teleservice is data exchange with physically remote technical plants (machines, plants, computers, etc.) for the purpose of error detection, diagnostics, maintenance, repair, or optimization.
TD	Text Display	—
TF	Technological functions	Application layer 7 for Industrial Ethernet (includes user services)
TFTP	Trivial File Transfer Protocol	Standard for data transmission
Thin Client	—	The principle of thin client/server computing is based on the fundamental physical separation of data.
TIA	Totally Integrated Automation	Fully integrated and company-wide system for automation from Siemens for company-wide configuration/programming, data management and communication.
TKIP	Temporal Key Integrity Protocol	Procedure for changing the keys in the WLAN
Token	—	The bit pattern with control function in token ring and token bus LANs; it is often the same as a send authorization
Token Passing	—	A collision-free access method, the send authorization (token) circulates between nodes which form a logical ring
Topology	Configuration of cables between the various nodes	The major forms of topology are: • Linear • Tree • Ring • Star Combinations of all basic types are possible.
TP	Touch panel	—
TPC	Transmission power control	Automatic regulation of the transmit power in the 5 GHz band
Trap	—	When specific events occur, such as link up or link down, alarms with corresponding error messages can be transmitted by network components on the Ethernet. In SNMP these alarms are called "traps".
Triaxial cable	—	The SIMATIC NET 727-0 bus cable is based on the coaxial cable specified in the 10Base5 standard (IEEE 802.3) – but strengthened with a thick aluminum outer sheath for industrial use.
Twisted-pair	Data cable with twisted pairs of conductors	The twist in the wire pairs provides good transmission properties and prevents electromagnetic interference. Twisted-pair cables are available in different qualities for different transfer rates
U		
UDP	User Datagram Protocol	Connectionless data transmission, i.e. datagram service that does not guarantee secure transmission. Users must take their own measures to ensure secure transmission. Data is transmitted as a data block. Transmission of data without RFC 1006 is thus possible.
UL	Underwriters Laboratories	Certification for the US market
UMTS	Universal Mobile Telecommunications System	Standard for third-generation (3G) mobile voice, audio, image, video, and data communication with a transmission rate of several Mbit/s
URECV	—	Uncoordinated reception of data

11

Appendix

Term	Meaning	Explanation
U		
USB	Universal Serial Bus	Standard for the connection of I/O devices. USB (Universal Serial Bus) supports relatively high data transmission rates and can be used to connect several devices to a single computer.
USEND	—	Uncoordinated transmission of data
V		
Variable Services	—	Application service group; it provides services for processing variables
VLAN	Local Area Network	Virtual LAN within a physical network. A widely used technical implementation of VLANs is partly defined in the IEEE 802.1Q standard.
VNS	Virtual Network Services	Centralized security mechanism for each user group that protects the data securely against unauthorized access and manipulation.
VPN	Virtual Private Network	Technology/network type for the secure transport of confidential data over potentially insecure IP networks, e.g. Internet
VRRP	Virtual Router Redundancy Protocol	Procedure for improving the availability of important gateways in local networks by means of redundant routers.
W		
WAN	Wide Area Network	Network that, in contrast to a LAN or MAN, can spread across countries or continents
WDS	Wireless Distribution System	Communication between two WLAN access points
WECA	Wireless Ethernet Compatibility Alliance	Alliance of wireless LAN product vendors who guarantee the compatibility of their products by means of testing.
WEP	Wired Equivalent Privacy	Encryption method for WLANs
Wi-Fi seal	Wireless Fidelity	Seal of the WECA identifying compatible and tested products .
WinCC	—	Open process visualization system for the operator control and process monitoring of SIMATIC HMI.
WirelessHART	—	Wireless HART communication to fieldbuses in the process industry. The HART Communication Foundation (HCF) specified WirelessHART and published it as a component of the HART Standard V7.1. The radio transmission is based on the wireless communications standard IEEE 802.15.4.
Wireless LAN	—	Wireless network
Workflow	—	Workflow systems are used when structuring and controlling workflows.
WPA	Wi-Fi Protected Access	Encryption mechanism in radio networks for protection against eavesdropping and unauthorized access
Write	—	The writing of data to remote stations
WS	Workstation	—
WWW	World Wide Web	Multimedia service on the Internet. Distributed hypertext information system on client/server architecture through HTTP protocol
X		
XML	Extensible Markup Language	Definition of a structured data description
XMP	X/Open Management Protocol	—
XTI	UNIX Transport Layer Interface	Layer 4 transport layer, standardized under UNIX
X.25	—	Interface between terminal and data transmission equipment for terminals which operate in packet mode in public data networks and are transported through dedicated lines

11

Faster and more applicable know-how: Hands-on training from the manufacturer

SITRAIN® – the Siemens Training for Industry – provides you with comprehensive support in solving your tasks.

Training by the market leader in automation and plant engineering enables you to make independent decisions with confidence. Especially where the optimum and efficient use of products and plants are concerned. You can eliminate deficiencies in existing plants, and exclude expensive faulty planning right from the beginning.

First-class know-how directly pays for itself: In shorter startup times, high-quality end products, faster troubleshooting and reduced downtimes. In other words, increased profits and lower costs.

Achieve more with SITRAIN

- Shorter times for startup, maintenance and servicing
- Optimized production operations
- Reliable configuration and startup
- Minimization of plant downtimes
- Flexible plant adaptation to market requirements
- Compliance with quality standards in production
- Increased employee satisfaction and motivation
- Shorter familiarization times following changes in technology and staff

Contact

SITRAIN highlights

Top trainers

Our trainers are skilled teachers with direct practical experience. Course developers have close contact with product development, and directly pass on their knowledge to the trainers.

Practical experience

The practical experience of our trainers enables them to teach theory effectively. But since theory can be pretty drab, we attach great importance to practical exercises which can comprise up to half of of the course time. You can therefore immediately implement your new knowledge in practice. We train you on state-of-the-art methodically/didactically designed training equipment. This training approach will give you all the confidence you need.

Wide variety

With a total of about 300 local attendance courses, we train the complete range of Siemens Industry products as well as interaction of the products in systems.

Tailor-made training

We are only a short distance away. You can find us at more than 50 locations in Germany, and in 62 countries worldwide. You wish to have individual training instead of one of our 300 courses? Our solution: We will provide a program tailored exactly to your personal requirements. Training can be carried out in our Training Centers or at your company.

The right mixture: Blended learning

"Blended learning" means a combination of various training media and sequences. For example, a local attendance course in a Training Center can be optimally supplemented by a teach-yourself program as preparation or follow-up. Additional effect: Reduced traveling costs and periods of absence.

11

Training program for SIMATIC NET

The SIMATIC NET trainings provide your employees the necessary overview and detailed skills for industrial communication. In addition to planning and configuration with SIMATIC NET, the use, programming, commissioning and servicing of the products are included in the training.

More information on course contents, dates and prices is available on the Internet at:

www.siemens.com/sitrain

Standards and approbations

CE marking

Overview

In as far as the electronic products described in this Catalog are subject to requirements and protection goals stipulated in EG guidelines, the relevant EG conformity declarations for the competent authorities are held available at:

SIMATIC:

Siemens AG
Industry Sector
IA AS EWA
Postfach 1963
D-92209 Amberg
GERMANY

SIMATIC NET:

SIEMENS AG
Industry Sector
IA SC IC
Postfach 4848
D-90327 Nürnberg
GERMANY

SIMATIC HMI:

SIEMENS AG
Industry Sector
IA AS SM ID
Postfach 4848
D-90327 Nürnberg
GERMANY

SIMATIC NET products are designed for operation in industrial environments and comply with the following requirements:

Noise emissions:
EN 61000-6-4: 2007
Noise immunity:
EN 61000-6-2: 2005

Selected modules comply with stringent requirements with regard to emitted interference and are therefore allowed to be used in an industrial as well as in a domestic environment:

Noise emissions:
EN 61000-6-3: 2007
Noise immunity:
EN 61000-6-2: 2005

Please take details regarding the fulfillment of specific European standards (EN) from the technical documents (manuals) associated with the product. Prerequisite for the fulfillment of the aforementioned protection goals is strict observance of the installation guidelines described in the manuals during the installation and operation of the products.

The installation guidelines described in the manuals and the important notes concerning installation in cabinets and the use of shielded cables must be complied with when installing and operating the products described in this catalog.

Notes for machine manufacturers

The SIMATIC automation system is not a machine in the sense of the EC Machinery Directive. For SIMATIC therefore no Declaration of Conformity in terms of the EC Machinery – Directive 89/392/EEC or 2006/42/EC (new edition, applicable from end of 2009) may be issued.

The EC Machinery Directive regulates the requirements for a machine or sub-unit of a machine. Machine in this context is defined as an entity of connected parts or devices (see also EN 292-1, Para. 3.1).

SIMATIC is part of the electrical equipment of a machine and must therefore be included in the assessment of the machine as a whole.

As an electrical resource, SIMATIC is subject to the low-voltage directive that, like the machine directive, also covers all hazards as a "total safety directive".

The EN 60204-1 standard (Safety of machines, general requirements – for the electrical equipment of machines) applies for the electrical equipment of machines.

The following table should help you when drawing up your declaration of conformity and shows which criteria apply to SIMATIC in accordance with EN 60204-1:2006/A1:2009.
You can obtain – further information from the enclosed declaration of conformity in accordance with the low-voltage and EMC directive (with the list of standards complied with).

EN 60204-1	Topic/criterion	Notes
Paragraph 4	General requirements	The requirements are met when the equipment is assembled/ installed in accordance with the installation guidelines. Please note the relevant information in the manuals
Paragraph 11.2	Digital input/output interfaces	The requirements are met
Paragraph 12.3	Programmable equipment	The requirements are met when the equipment is installed in lockable cabinets to protect against alteration of the memory contents by unauthorized persons.
Paragraph 20.4	Voltage tests	The requirements are met

11

Certificates, authorizations, approbations, declarations of conformity

An overview of the certificates available for SIMATIC NET products (CE, UL, CSA, FM, shipping authorizations) and classification figures (MTBF) can be found in the Internet at:

www.siemens.com/simatic-net

Other certificates for SIMATIC products can be found in the Internet at:

SIMATIC
www.siemens.com/simatic/certificates

Industrial Controls
www.siemens.com/industrial-controls/support

The lists are continuously updated. The data for products which has not yet been included in the overview is continuously collected and prepared for the subsequent edition.

You can find certificates, approbations, verification certificates or characteristic curves under:

Support\Infomaterial\Certificates

or by going directly to the Link Box:

Quality management

The quality management system of the Industry Sector, Industry Automation division, complies with the international standard EN ISO 9001.

The products and systems described in this catalog are sold under application of a quality management system certified by DQS and TÜV (German Technical Inspectorate) in accordance with ISO 9001.

The certificates are recognized in all EQ Net countries.

Partner at Industry Automation and Drive Technologies

Siemens contacts worldwide

Overview

At Siemens Industry Automation and Drive Technologies, more than 85 000 people are resolutely pursuing the same goal: long-term improvement of your competitive ability. We are committed to this goal. Thanks to our commitment, we continue to set new standards in automation and drive technology. In all industries – worldwide.

At your service locally, around the globe for consulting, sales, training, service, support, spare parts ... on the entire Industry Automation and Drive Technologies range.

Your personal contact can be found in our Contacts Database at: www.siemens.com/automation/partner

You start by selecting a

- Product group,
- Country,
- City,
- Service.

■ **Overview**

Siemens Solution Partner Automation

Solution Partner: Highest quality - guaranteed

The products and systems from Siemens Industry Automation and Drive Technologies offer the ideal platform for all automation applications.

Under the name of Siemens Solution Partner Automation, selected system integrators around the world act as uniformly qualified solution providers for the Siemens range of products and services in the fields of automation and drives. Day after day, they utilize their qualified product and system know-how as well as their excellent industry expertise to your advantage – for all requirements.

The partner emblem is the guarantee and indicator of proven quality. The basis for this are defined quality features that identify Solution Partners as reliable and competent solution providers:

- Solution quality
  Always a good result with tried and tested solutions expertise.
- Expert quality
  Certified technical competence ensures maximum efficiency.
- Project quality
  With proven project experience straight to the target.
- Portfolio quality
  Comprehensive portfolio for state-of-the-art solutions from a single source.

Solution Partner Finder

The Siemens Solution Partner Program helps you to find the optimum partner for your specific requirements.

Support is provided by the Solution Partner Finder, a comprehensive online platform that showcases the profiles of all our solution partners. You can convince yourself of the competence of the respective Solution Partner by means of the references provided. Various search criteria are available for this purpose.

Once you have located a partner, you are only one small step away from contacting them.

Find the right partner here for your specific task and convince yourself of the solution competence provided:

www.siemens.com/automation/partnerfinder

Additional information on the Siemens Solution Partner Program is available online at:

www.siemens.com/automation/solutionpartner

Appendix
Online Services

Siemens Industry Automation and Drive Technologies in the WWW

A detailed knowledge of the range of products and services available is essential when planning and configuring automation systems. It goes without saying that this information must always be fully up-to-date.

Siemens Industry Automation and Drive Technologies has therefore built up a comprehensive range of information in the World Wide Web, which offers quick and ea sy access to all data required.

Under the address

www.siemens.com/industry

you will find everything you need to know about products, systems and services.

Product Selection Using the Interactive Catalog CA 01 of Industry

Detailed information together with convenient interactive functions:
The interactive catalog CA 01 covers more than 80 000 products and thus provides a full summary of the Siemens Industry Automation and Drive Technologies product base.

Here you will find everything that you need to solve tasks in the fields of automation, switchgear, installation and drives.
All information is linked into a user interface which is easy to work with and intuitive.

After selecting the product of your choice you can order at the press of a button, by fax or by online link.

Information on the interactive catalog CA 01 can be found in the Internet under

www.siemens.com/automation/ca01

or on DVD.

Easy Shopping with the Industry Mall

The Industry Mall is the virtual department store of Siemens AG in the Internet. Here you have access to a huge range of products presented in electronic catalogs in an informative and attractive way.

Data transfer via EDIFACT allows the whole procedure from selection through ordering to tracking of the order to be carried out online via the Internet.

Numerous functions are available to support you.

For example, powerful search functions make it easy to find the required products, which can be immediately checked for availability. Customer-specific discounts and preparation of quotes can be carried out online as well as order tracking and tracing.

Please visit the Industry Mall on the Internet under:

www.siemens.com/industrymall

11

The unmatched complete service for the entire life cycle

For machine constructors, solution providers and plant operators: The service offering from Siemens Industry, Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant - from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drives from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees - even across continents - ensure reliable service in the most diverse areas.

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

www.siemens.com/
automation/service&support

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consulting on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

www.siemens.com/
automation/support-request

Training

Extend your competitive edge - through practical know-how directly from the manufacturer.

www.siemens.com/sitrain

Contact information is available in the Internet at:
www.siemens.com/automation/partner

11

Appendix
Service & Support

**The unmatched complete service
for the entire life cycle**

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance - to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum - with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs. To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization - with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are selected service packages for an automation and drives system or product group. The individual services are coordinated with each over to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a Service Program can be flexibly adapted at any time and used separately.

Examples of service programs:
- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Servicess

Advantages at a glance:
- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Comprehensive service from a single source, fewer interfaces and greater expertise

Contact information is available in the Internet at:
www.siemens.com/automation/partner

Knowledge Base on DVD

For locations without online connections to the Internet there are excerpts of the free part of the information sources available on DVD (Service & Support Knowledge Base). This DVD contains all the latest product information at the time of production (FAQs, Downloads, Tips and Tricks, Updates) as well as general information on Service & Support.

The DVD also includes a full-text search and our Knowledge Manager for targeted searches for solutions. The DVD will be updated every 4 months.

Just the same as our online offer in the Internet, the Service & Support Knowledge Base on DVD comes complete in 5 languages (German, English, French, Italian, Spanish).

You can order the **Service & Support Knowledge Base** DVD from your Siemens contact.

Order no. **6ZB5310-0EP30-0BA2**

Automation Value Card

By entering the card number and PIN you have full access to the Service & Support services being offered. The charge for the services procured is debited from the credits on your Automation Value Card.

All the services offered are marked in currency-neutral credits, so you can use the Automation Value Card worldwide.

Order your Automation and Value Card easily and comfortably like a product with your sales contact.

Automation Value Card order numbers	
Credits	Order no.
200	**6ES7 997-0BA00-0XA0**
500	**6ES7 997-0BB00-0XA0**
1 000	**6ES7 997-0BC00-0XA0**
10 000	**6ES7 997-0BG00-0XA0**

Detailed information on the services offered is available on our Internet site at:

www.siemens.com/automation/service&support

Service & Support à la Card: Examples

Technical Support	
"Priority"	Priority processing for urgent cases
"24 h"	Availability round the clock
"Extended"	Technical consulting for complex questions
"Mature Products"	Consulting service for products that are not available any more
Support Tools in the Support Shop	
	Tools that can be used directly for configuration, analysis and testing

Small card - great support

The Automation Value Card is an integral component of the comprehensive service concept with which Siemens Automation and Drives will accompany you in each phase of your automation project.

It doesn't matter whether you want just specific services from our Technical Support or want to purchase something on our Online portal, you can always pay with your Automation Value Card. No invoicing, transparent and safe. With your personal card number and associated PIN you can view the state of your account and all transactions at any time.

Services on card. This is how it's done.

Card number and PIN are on the back of the Automation Value Card. When delivered, the PIN is covered by a scratch field, guaranteeing that the full credit is on the card.

11

Appendix

Safety of electronic devices

Overview

The information listed here is mainly of a fundamental nature and applies regardless of the type and vendor of the electronic control system.

Reliability

The reliability of devices and components is being driven as high as possible by employing extensive and cost-effective measures in development and production.

This includes

- Selection of high-quality components;
- Worst-case design calculation of all circuits;
- Systematic and computer-controlled testing of all subcontracted components;
- Burn-in of all large-scale integrated circuits (e.g. processors, memories etc.);
- Measures to prevent static charging when working at or with MOS circuits;
- Visual checks at various stages of production;
- In-circuit testing of all modules, i.e. computer-aided testing of all components and their interaction in the circuit;
- Hot endurance run at high ambient temperature over several days;
- Meticulous computer-controlled final testing;
- Statistical evaluation of all returns for immediate introduction of remedial actions.

These measures are regarded a basic measures in safety engineering. They prevent or keep control of the majority of potential faults.

Risks

Wherever faults are liable to cause injury to persons or damage to property it is necessary to introduce measures aimed in particular at the safety of the plant and, therefore, of the control system. Special, plan-specific directives exist for these applications and need to be taken into account when configuring the control system.

In the case of safety-relevant electronic control systems the measures needing to be taken to prevent or keep control of faults are aimed at the risk presented by the plant. In such a case the basic measures listed above are no longer sufficient above a certain level of hazard potential. Additional measures have to be implemented and certified (e.g.dual-channel arrangements, tests, checksums etc.) for the control system.

Division into a safe and a non-safe zone

In practically all plants there are parts which perform safety-related functions (e.g. emergency stop pushbuttons, mesh guards, two-hand controls). In order not to have to consider the complete control system in terms of safety engineering it is customary to divide the control system into a **safe** and a **non-safe** zone. No special requirements are imposed on the safety of the control system in the non-safe zone because there would be no impact on the safety of the plant if the electronics failed in this case. In the safe zone, on the other hand, you are only allowed to use control systems and/or circuits which satisfy the directives in question.

The following zonal divisions are customary in practice:
- Control systems with little safety engineering, e.g. machine control systems.
- Control systems with balanced zones, e.g. chemical plants, aerial ropeways.
- Control systems with mainly safety engineering, e.g. incineration plants.

Important

Even if a maximum of design-based safety is achieved in the configuration of an electronic control systems – e.g. through multi-edge configuration – it is still essential to closely follow the instructions in the operating manuals as otherwise wrong actions may suspend precautions for preventing potential faults or may create additional sources of danger.

11

■ Overview

Software types

Software requiring a license is categorized into types.
The following software types have been defined:

- Engineering software
- Runtime software

Engineering software

This includes all software products for creating (engineering) user software, e.g. for configuring, programming, parameterizing, testing, commissioning or servicing.

Data generated with engineering software and executable programs can be duplicated for your own use or for use by third-parties free-of-charge.

Runtime software

This includes all software products required for plant/machine operation, e.g. operating system, basic system, system expansions, drivers, etc.

The duplication of the runtime software and executable programs created with the runtime software for your own use or for use by third-parties is subject to a charge.

You can find information about license fees according to use in the ordering data (e.g. in the catalog). Examples of categories of use include per CPU, per installation, per channel, per instance, per axis, per control loop, per variable, etc.

Information about extended rights of use for parameterization/configuration tools supplied as integral components of the scope of delivery can be found in the readme file supplied with the relevant product(s).

License types

Siemens Industry Automation & Drive Technologies offers various types of software license:

- Floating license
- Single license
- Rental license
- Trial license

Floating license

The software may be installed for internal use on any number of devices by the licensee. Only the concurrent user is licensed. The concurrent user is the person using the program. Use begins when the software is started.
A license is required for each concurrent user.

Single license

Unlike the floating license, a single license permits only one installation of the software.

The type of use licensed is specified in the ordering data and in the Certificate of License (CoL). Types of use include for example per device, per axis, per channel, etc.

One single license is required for each type of use defined.

Rental license

A rental license supports the "sporadic use" of engineering software. Once the license key has been installed, the software can be used for a specific number of hours (the operating hours do not have to be consecutive).
One license is required for each installation of the software.

Trial license

A trial license supports "short-term use" of the software in a non-productive context, e.g. for testing and evaluation purposes.
It can be transferred to another license.

Factory license

With the Factory License the user has the right to install and use the software at one permanent establishment only. The permanent establishment is defined by one address only. The number of hardware devices on which the software may be installed results from the order data or the Certificate of License (CoL).

Certificate of license

The Certificate of License (CoL) is the licensee's proof that the use of the software has been licensed by Siemens. A CoL is required for every type of use and must be kept in a safe place.

Downgrading

The licensee is permitted to use the software or an earlier version/release of the software, provided that the licensee owns such a version/release and its use is technically feasible.

Delivery versions

Software is constantly being updated.
The following delivery versions

- PowerPack
- Upgrade

can be used to access updates.

Existing bug fixes are supplied with the ServicePack version.

PowerPack

PowerPacks can be used to upgrade to more powerful software. The licensee receives a new license agreement and CoL (Certificate of License) with the PowerPack. This CoL, together with the CoL for the original product, proves that the new software is licensed.
A separate PowerPack must be purchased for each original license of the software to be replaced.

11

Appendix

Software Licenses

■ Overview (continued)

Upgrade

An upgrade permits the use of a new version of the software on the condition that a license for a previous version of the product is already held.

The licensee receives a new license agreement and CoL with the upgrade. This CoL, together with the CoL for the previous product, proves that the new version is licensed.

A separate upgrade must be purchased for each original license of the software to be upgraded.

Software Update Service

The SIMATIC NET Software Update Service includes automatic delivery of the relevant updates of the SIMATIC NET PC software CD, which is available following the signing of the contract.

The CD contains SIMATIC NET software for Industrial Ethernet, PROFINET, OPC server and PROFIBUS, so that your software is

always up to date.

The following boundary conditions apply:

- The customer must already have a current software version, so an update/upgrade may be required beforehand.
- The update service is valid for one year following the date specified in the order.
- It shall be extended automatically for a further year, provided that it is not cancelled 3 months in advance by the customer or by the responsible Siemens partner.
- When the contract is extended, the customer will be invoiced for the cost of a further year.

ServicePack

ServicePacks are used to debug existing products. ServicePacks may be duplicated for use as prescribed according to the number of existing original licenses.

License key

Siemens Industry Automation & Drive Technologies supplies software products with and without license keys.

The license key serves as an electronic license stamp and is also the "switch" for activating the software (floating license, rental license, etc.).

The complete installation of software products requiring license keys includes the program to be licensed (the software) and the license key (which represents the license).

Detailed explanations concerning license conditions can be found in the "Terms and Conditions of Siemens AG" or under www.siemens.com/industrymall (Industry Mall Online-Help System)

■ Your opinion is important to us!

Our catalog should be an important and frequently used document. For this reason we are continuously endeavoring to improve it.

A small request on our part to you:
Please take time to fill in the following form and fax it to us.

Thank You!

■ We invite you to grade our catalog on a point system from 1 (= good) to 6 (= poor):

Do the contents of the catalog live up to your expectations? ☐

Do the technical details meet your expectations? ☐

Is the information easy to find? ☐

How would you assess the graphics and tables? ☐

Can the texts be readily understood? ☐

■ Did you find any printing errors?

11

Appendix

Terms and Conditions of Sale and Delivery

By using this catalog you can acquire hardware and software products described therein from Siemens AG subject to the following terms. Please note! The scope, the quality and the conditions for supplies and services, including software products, by any Siemens entity having a registered office outside of Germany, shall be subject exclusively to the General Terms and Conditions of the respective Siemens entity. The following terms apply exclusively for orders placed with Siemens AG.

For customers with a seat or registered office in Germany

The "General Terms of Payment" as well as the "General Conditions for the Supply of Products and Services of the Electrical and Electronics Industry" shall apply.

For software products, the "General License Conditions for Software Products for Automation and Drives for Customers with a Seat or registered Office in Germany" shall apply.

For customers with a seat or registered office outside of Germany

The "General Terms of Payment" as well as the "General Conditions for Supplies of Siemens, Automation and Drives for Customers with a Seat or registered Office outside of Germany" shall apply.

For software products, the "General License Conditions for Software Products for Automation and Drives for Customers with a Seat or registered Office outside of Germany" shall apply.

General

The dimensions are in mm. In Germany, according to the German law on units in measuring technology, data in inches only apply to devices for export.

Illustrations are not binding.

Insofar as there are no remarks on the corresponding pages, - especially with regard to data, dimensions and weights given - these are subject to change without prior notice.

The prices are in € (Euro) ex works, exclusive packaging.

The sales tax (value added tax) is not included in the prices. It shall be debited separately at the respective rate according to the applicable legal regulations.

Prices are subject to change without prior notice. We will debit the prices valid at the time of delivery.

Surcharges will be added to the prices of products that contain silver, copper, aluminum, lead and/or gold if the respective basic official prices for these metals are exceeded. These surcharges will be determined based on the official price and the metal factor of the respective product.

The surcharge will be calculated on the basis of the official price on the day prior to receipt of the order or prior to the release order.
The metal factor determines the official price as of which the metal surcharges are charged and the calculation method used. The metal factor, provided it is relevant, is included with the price information of the respective products.

An exact explanation of the metal factor and the text of the Comprehensive Terms and Conditions of Sale and Delivery can be downloaded at:

Export regulations

Our obligation to fulfill this agreement is subject to the proviso that the fulfillment is not prevented by any impediments arising out of national and international foreign trade and customs requirements or any embargos and/or other sanctions.

If you transfer goods (hardware and/ or software and/ or technology as well as corresponding documentation, regardless of the mode of provision) delivered by us or works and services (including all kinds of technical support) performed by us to a third party worldwide, you shall comply with all applicable national and international (re-) export control regulations.

If required to conduct export control checks, you, upon request by us, shall promptly provide us with all information pertaining to particular end customer, destination and intended use of goods, works and services provided by us, as well as any export control restrictions existing.

The products listed in this catalog / price list may be subject to European / German and/or US export regulations.

Therefore, any export requiring a license is subject to approval by the competent authorities.

According to current provisions, the following export regulations must be observed with respect to the products featured in this catalog / price list:

AL	Number of the German Export List
	Products marked other than "N" require an export license. In the case of software products, the export designations of the relevant data medium must also be generally adhered to.
	Goods labeled with an "AL" not equal to "N" are subject to a European or German export authorization when being exported out of the EU.
ECCN	Export Control Classification Number
	Products marked other than "N" are subject to a reexport license to specific countries.
	In the case of software products, the export designations of the relevant data medium must also be generally adhered to.
	Goods labeled with an "ECCN" not equal to "N" are subject to a US re-export authorization.

Even without a label or with an "AL: N" or "ECCN: N", authorization may be required due to the final destination and purpose for which the goods are to be used.

The deciding factors are the AL or ECCN export authorization indicated on order confirmations, delivery notes and invoices.

Errors excepted and subject to change without prior notice.
